Dear Editor,

I am hereby submitting the paper, "International Attitudes Toward Global Policies," co-authored with Thomas Douenne and Linus Mattauch.

Redistributive policies coordinated at the global level, including climate and taxation measures, remain understudied. Except for Carattini, Kallbekken & Orlov (2019),<sup>1</sup> published as a Comment in *Nature*, little research delves into these critical areas. Our study addresses this gap using representative surveys in 20 countries over 48,000 respondents.

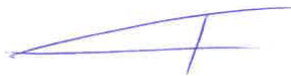

Our surveys reveal strong and genuine support for global redistributive policies worldwide. It points to an overlooked property of climate policies or taxation at the global level: they can be supported by majorities, even in countries bearing the burden.

These findings have far-reaching implications for global policy dialogues, such as UNFCCC COP negotiations, discussions about the UN Tax Convention, and the recent Summit for a New Global Financial Pact. These research results could potentially reshape international policy discussions.

We would like to exclude Stefano Carattini, Kenneth Scheve and Michael Bechtel from a set of potential reviewers.

Sincerely,

Dr. Adrien Fabre
