

International Attitudes Toward Global Policies

Adrien Fabre*, Thomas Douenne[†] and Linus Mattauch^{‡§}

July 31, 2024

Abstract

We document majority support for policies entailing global redistribution and climate mitigation. Surveys on 40,680 respondents in 20 countries show strong stated support for an effective way to jointly combat climate change and poverty: a global carbon price funding a global basic income, called the “Global Climate Scheme” (GCS). Using complementary surveys on 8,000 respondents in the U.S., France, Germany, Spain, and the UK, we test several hypotheses that could reconcile strong stated support with a lack of salience in policy circles. The GCS is supported by three quarters of Europeans and half of Americans, even as they understand the policy’s cost to them. Using different experiments, we show that the support for the GCS is sincere and that electoral candidates could win votes by endorsing it. More generally, we document widespread support for other globally redistributive policies, such as a wealth tax funding low-income countries or increased foreign aid. In sum, we provide evidence that global policies are genuinely supported by majorities, even in wealthy nations that would bear the burden.

1 Introduction

Major sustainability objectives could be achieved by global approaches to mitigating climate change and poverty involving transfers from high- to lower-income countries (Bauer et al. 2020; Budolfson et al. 2021; Cramton et al. 2017; Dennig et al. 2015; Franks et al. 2018; Soergel et al. 2021). For instance, a global wealth tax could finance the Sustainable Development Goals (Piketty 2022). More specifically, if merely 35% of the revenue were allocated for this purpose, a global 2% tax on individual wealth in excess of \$5 million could significantly reduce poverty as it would mechanically increase low-income countries' national income by 50% (as computed on the [WID wealth tax simulator](#)). Besides, global carbon pricing is widely regarded by economists as the benchmark climate policy, as it would efficiently correct the carbon emissions externality. In an early analysis of global climate policy, Grubb (1990) states: "by far the best combination of long term effectiveness, feasibility, equity, and simplicity, is obtained from a system based upon tradable permits for carbon emissions which are allocated on an adult per capita basis", i.e., equally among human adults. Support for such solution, which we call the "Global

Climate Scheme”, has been renewed ever since (Agarwal & Narain 1991; Baer et al. 2000; Bertram 1992; Blanchard & Tirole 2021; Hoel 1991; Jamieson 2001; Rajan 2021).

While international negotiations have not yet led to ambitious globally redistributive policies, recent developments suggest that such a change might be underway. The International Maritime Organization is poised to adopt a global carbon levy on maritime fuel; the African Union (2023) calls for a global carbon taxation regime; the UN (2023) is setting up a Framework Convention on International Tax Cooperation; Brazil uses its presidency of the G20 in 2024 to propose a global wealth tax, **backed** by 130 Members of the European Parliament; etc.

A key condition for implementing global policies has remained largely unaddressed: the support of citizens. Using a Global survey on 40,680 respondents from 20 high-and middle-income countries, we reveal substantial support for those policies, especially global climate policies and a global tax on the wealthiest aimed at financing low-income countries (other questions from these surveys are analyzed in a companion paper, Dechezleprêtre et al. 2022). Interestingly, even in wealthy nations that would bear a significant burden, majorities of citizens express support for such globally redistributive policies. To better understand public support for global policies in high-income countries, we conduct Complementary surveys among 8,000 respondents from France, Germany, Spain, the U.S., and the UK.

By studying in depth the support for global policies, we are making an ambitious shift in the methodological approach of attitudinal surveys. In general, academic surveys focus on studying effect sizes of some treatment on political attitudes, or the socio-demographic factors that correlate with attitudes (e.g., Douenne & Fabre 2022; Kuziemko et al. 2015). The magnitude of support for a given proposal is often regarded as problematic to estimate satisfactorily. The measure of support is usually left to non-academic pollsters, who rarely apply all the academic best practices: transparency, representative sampling, neutral and precise wording of questions, comparison with existing literature, use of multiple questions and complementary methods to correctly interpret the results. Although it is challenging to estimate the extent of support, this question seems too important not to be addressed using scientific methods. Absent large scale measurements of public opinion like referenda, surveys remain the best method to assess support or opposition to given policies. In this paper, after a worldwide assessment in the Global survey, we use Complementary surveys to carefully measure the support for global policies in Western countries. We inquire the support for various policies, approach the question from di-

verse angles, and run a battery of pre-registered tests to check whether stated support estimates are reliable.

The focus of the Complementary surveys is a specific policy aimed at addressing both climate change and poverty, referred to as the “Global Climate Scheme” (GCS). It implements a cap on carbon emissions to limit global warming below 2°C. The emission rights are auctioned each year to polluting firms and fund a global basic income, alleviating extreme poverty. This archetypal policy exposes respondents to the key trade-off between the benefits and costs of globally redistributive climate policies, as respondents are made aware of the cost that the GCS entails for their country’s people.

After checking that respondents have understood the policy and its cost, we measure the support in a direct Yes/No question. The GCS is supported by three quarters of Europeans and more than half of Americans. Then, we test for social desirability bias using a list experiment. We find no evidence that people exaggerate their support in the direct question. To assess whether the support would diminish in a context with real stakes, we ask respondents whether they are willing to sign a petition in favor of the GCS, after informing them that the question results will be communicated to their head of state’s office. The support is sustained in an environment that approaches real stakes. We then carry out conjoint analyses to neutralize experimenter demand and investigate the priority given to global policies compared to other types of policies. Conjoint analyses reveal that a political platform is more likely to be preferred if it contains the GCS or a global tax on millionaires, and that global policies rank high in the prioritization of policies. Our randomized experiments also show that a candidate would not lose vote intentions by endorsing the GCS, and might even gain up to 11 points in a country like France. An analysis of open-ended fields confirms that support for the GCS is real, and indicates that appeal of the GCS comes from its international nature and its impacts on climate, more than on global poverty. We also test other global policies and universalistic attitudes. Support is very strong for a global tax on millionaires, and the median respondent prefers to allocate 30% of the revenues of such a tax to low-income countries. Majorities are willing to increase foreign aid, but only if some conditions are respected, such as making sure the aid is well spent and other high-income countries also increase their contribution. Questions on universalistic values, including a donation experiment, confirm the congruence of underlying values with the support for specific policies. Our diverse approaches also help understand what drives the support. For instance, the evidence indicates that one key reason why increasing foreign aid is not as popular as global policies lies in its unilat-

eral nature. We reckon that survey evidence is no panacea, as attitudes can be ambivalent and context-dependent. Nevertheless, we arguably employ the best available methods to address potential concerns, including an experiment assessing how support might be affected by a negative media campaign.

Overall, our results point out to strong and genuine support for global climate and redistributive policies, as our experiments confirm the stated support found in direct questions. This suggests that carefully administered surveys can be used to measure the level of support for a given policy. Our results contribute to the literature on attitudes toward climate policy, confirming that climate policy is preferred at a global level (Beiser-McGrath & Bernauer 2019b; ISSP 2010; Meilland et al. 2023; Sivonen 2022), where it is more effective and fair. Indeed, the Global Climate Scheme is largely supported, but a similar policy at the national level is opposed by a majority in many countries (Dechezleprêtre et al. 2022), despite lower costs. Noting that only 13% of French people declared supporting a national carbon tax with cash transfers during the Yellow Vests movement (Douenne & Fabre 2022), surveys appear to accurately reflect the level of support. Therefore, unless support for global policies disappear once they enter the public debate, it seems unlikely that a policy such as the GCS would face major protests. In our discussion we offer potential explanations behind the lack of prominence of global policies in the public debate despite this strong support. Finally, while our findings underscore majority support for global policies, converging results from independent surveys are needed to ascertain such novel evidence.

Literature International surveys have shown widespread support for costly climate action (Dechezleprêtre et al. 2022; Leiserowitz et al. 2022). For instance, using representative samples in 125 countries covering 96% of the world's greenhouse gas emissions, Andre et al. (2024) show that 69% of the global population express willingness to contribute 1% of their income to fight global warming. International surveys have also uncover near consensus that "present economic differences between rich and poor countries are too large" (overall, 78% agree and 5% disagree) in each of 29 countries (ISSP 2019).

Yet, few prior attitudinal surveys have examined global redistributive policies. A notable exception is Carattini et al. (2019), who test the support for six variants of a global carbon tax on samples in five countries, representative along gender and age. For a given variant, the sample size is about 167 respondents per country. They find over 80% support for any variant in India, between 50% and 65% in Australia, the UK and South Africa, and

43% to 59% in the U.S., depending on the variant. Notably, the support for a global carbon tax funding an equal cash transfer for each human is close to 50% in high-income countries (e.g., at 44% in the U.S.). These figures are consistent with our results from the *Global* survey (see Figure 1), where the support is lower for a tax that would “only” reduce CO₂ emissions than for a quota that would unambiguously achieve the climate target. Relatedly, Leiserowitz et al. (2021) reveal that 66% of Americans support providing “financial aid and technical support to developing countries that agree to limit their greenhouse gas emissions”; and Fehr et al. (2022) find that 90% of Germans want some degree of global redistribution. Besides, in surveys conducted in Brazil, Germany, Japan, the UK and the U.S., Ghassim (2020) finds support ranging from 55% to 74% for “a global democracy including both a global government and a global parliament, directly elected by the world population, to recommend and implement policies on global issues”. Through an experiment, he also finds that, in countries where the government stems from a coalition, voting shares would shift by 8 (Brazil) to 12 p.p. (Germany) from parties who are said to oppose global democracy to parties that supposedly support it. For instance, when Germans respondents were told that (only) the Greens and the Left support global democracy, these parties gained respectively 9 and 3 p.p. in vote intentions, while the SPD and the CDU-CSU each lost 6 p.p.

Appendix A contains a broader literature review including further attitudinal surveys on global policies (A.1.1); prior work on attitudes toward climate burden sharing (Appendix A.1.2), attitudes toward foreign aid (Appendix A.1.3); global carbon pricing (Appendix A.2.1), global redistribution (Appendix A.2.3), basic income (Appendix A.2.4), and global democracy (Appendix A.2.5).

2 Results

The presentation of results proceeds as follows: after briefly describing the survey data (2.1), we first document broad international support for global approaches to climate policy that lead to global redistribution (2.2.1). Subsequently, we present specific findings from surveys in the U.S. and Europe that document support for the GCS, wealth taxes, and foreign aid in those countries (2.2.2-2.2.5). We proceed to study the support for the Global Climate Scheme in more detail, by means of a list experiment, petition, conjoint analyses, prioritization task, and by eliciting pros and cons (2.3). To understand the gap between support for global policies and their appearance in public discussion, we

conclude by reporting results on underlying universalistic values (2.4) and beliefs about the support of others (2.5).

2.1 Data

The study relies on two sets of surveys: the *Global* survey and the *Complementary* surveys (see Table S1).

Table S1: [For Supplementary Material] Summary of the surveys used in the analysis.

Survey	<i>Global survey</i>	<i>Complementary surveys</i>		
	<i>Global</i>	<i>Eu</i>	<i>US1</i>	<i>US2</i>
Country coverage	20 countries	FR, DE, ES, UK	U.S.	U.S.
Sample size	40,680	3,000	3,000	2,000
Main purpose	Stated support for global policies	Focus on GCS (sincerity, rationales, etc.) + Support for global redistribution + Universalistic values		

Global Survey The *Global* survey, conducted in 2021, involved 40,680 respondents from 20 countries, representing approximately 72% of global CO₂ emissions. This survey serves as the basis for measuring stated support for various global policies worldwide. Detailed information about the data collection process, sample representativeness, and analysis of questions on national policies can be found in [Dechezleprêtre et al. \(2022\)](#).

Complementary Surveys To delve deeper into the sincerity and rationales behind support for the GCS and attitudes towards global policies, global redistribution, and universalistic values, complementary surveys were conducted in 2023. These surveys are based on a sample of 8,000 respondents from France, Germany, Spain, the UK, and the U.S. The European survey (*Eu*) comprises 3,000 respondents, while the U.S. sample was collected in two separate waves: *US1* with 3,000 respondents and *US2* with 2,000 respondents. The survey questions in both the European and U.S. surveys are identical, except for an additional question in *US2* that uses results from *US1* to assess the bandwagon effect.

The complementary surveys ensured representativeness along key dimensions: gender, income, age, highest diploma, and degree of urbanization. The *Eu* survey is also representative of its four countries in terms of population size, while the *US1* and *US2*

surveys are representative in terms of region and ethnicity. Tables S9-S10 confirm that our samples closely match population frequencies. More detail on data collection is given in Section Methods. The questionnaires used in the surveys are provided in Appendices C and D.

2.2 Stated support for global policies

2.2.1 Global support

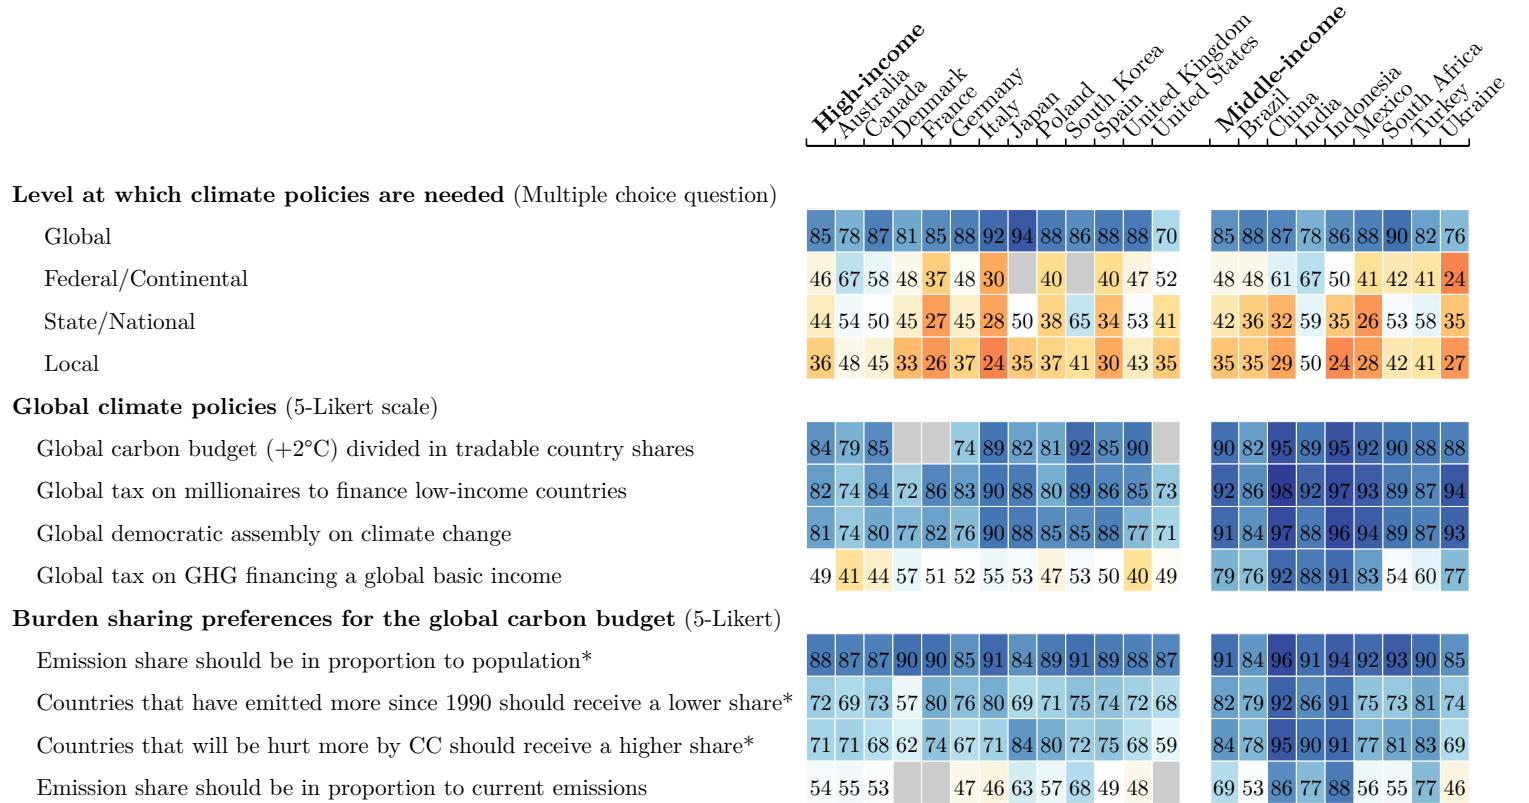

The Global survey shows strong support for climate policies enacted at the global level (Figure 1). When asked “At which level(s) do you think public policies to tackle climate change need to be put in place?”, 70% (in the U.S.) to 94% (in Japan) choose the global level. The next most popular choice is the federal or continental level, favored by 52% of Americans and less than half of European respondents. Local policies receive the least support. This preference for climate policies implemented at the global scale is in line with Beiser-McGrath & Bernauer (2019b) and consistent with individuals’ concerns for the fairness and effectiveness of such policies, which have been identified as two of the three key determinants of support, besides self-interest (Dechezleprêtre et al. 2022; Douenne & Fabre 2022; Klenert et al. 2018).

Among the four global climate policies examined in the *Global* survey, three policies garner high support across all countries (Figure 1). These policies include a global democratic assembly on climate change, a global tax on millionaires to finance low-income countries contingent on their climate action, and a global carbon budget of +2°C divided among countries based on tradable shares (or “global quota”), with the allocation of country shares unspecified.¹ The three policies garner a majority of absolute support (i.e., “somewhat” or “strong” support) in all countries (except in the U.S. for the global assembly, 48% absolute support). In high-income countries, the global quota policy obtains 64% absolute support and 84% relative support (i.e., excluding “indifferent” answers).

Following the support for the global quota, respondents are asked about their pref-

¹The policies were all described with further details to make sure people understood them. Specifically, the policies were presented as follows: an international emissions trading system where “countries that emit more than their national share would pay a fee to countries that emit less than their share”; “a tax on all millionaires in dollars around the world to finance low-income countries that comply with international standards regarding climate action [which] would finance infrastructure and public services such as access to drinking water, healthcare, and education”; “a global democratic assembly whose role would be to draft international treaties against climate change [where] each adult across the world would have one vote to elect members of the assembly”.

Figure 1: Relative support for global climate policies.

Note 1: The numbers represent the share of *Somewhat* or *Strongly support* among non-*indifferent* answers (in percent, $n = 40,680$). The color blue denotes a relative majority. See Figure S11 for the absolute support. (Questions A-I).

Note 2: *In Denmark, France and the U.S., the questions with an asterisk were asked differently, cf. Question F.

erences for dividing the carbon budget among countries, as depicted in the third block of Figure 1. Consistent with the existing literature (see Appendix A.1.2), an equal per capita allocation of emission rights emerges as the preferred burden-sharing principle, garnering absolute majority support in all countries and never below 84% relative support. Taking into account historical responsibilities or vulnerability to climate damages is also popular, albeit with less consensus, while grandfathering (i.e., allocation of emission shares in proportion to current emissions) receives the least support in all countries.

A global quota with equal per capita emission rights should produce the same distributional outcomes as a global carbon tax that funds a global basic income.² The support

²Similarly, a global quota with grandfathering is equivalent to a global carbon tax where each country

for the global carbon tax is also tested and its redistributive effects – the average increase in expenditures along with the amount of the basic income – are specified to the respondents explicitly (see box below and Appendix D, p. 92). The support for the carbon tax is lower than for the quota, particularly in high-income countries, and there is no relative majority for the tax in Anglo-Saxon countries.³ Two possible reasons for this lower support are that distributive effects are made salient in the case of the tax, and that people may prefer a quota, perhaps because they find it more effective than a tax to reduce emissions. This interpretation is consistent with the level of support for the global quota once we make the distributive effects salient, as we do in the complementary surveys.

2.2.2 Global Climate Scheme

The complementary surveys (*US1, US2, Eu*) consist of a comprehensive exploration of citizens' attitudes towards the GCS. We present to respondents a detailed description of the GCS and explain its distributive effects, including specific amounts at stake (as specified in the box below). Furthermore, we assess respondents' understanding of the GCS with incentivized questions to test their comprehension of the expected financial outcome for typical individuals in high-income countries (loss) and the poorest individuals globally (gain), followed by the provision of correct answers (Figures S12-S13). The same approach is applied to a National Redistribution scheme (NR) targeting the top 5% (in the U.S.) or top 1% (in Europe) with the aim of financing cash transfers to all adults,⁴ calibrated to offset the monetary loss of the GCS for the median emitter in their country. We evaluate respondents' understanding that the richest would lose and the typical fellow citizens would gain from that policy. Subsequently, we summarize both schemes to enhance respondents' recall. Additionally, we present a final incentivized comprehension question and provide the expected answer that the combined GCS and NR would result in no net gain or loss for a typical fellow citizen. Finally, respondents are directly asked to express their support for the GCS and NR using a simple Yes/No question.

The stated support for the GCS is 54% in the U.S. and 76% in Europe,⁵ while the

keeps the revenues it collects.

³The levels of support are consistent with the findings of Carattini et al. (2019), the only previous study that tested a global carbon tax.

⁴The wider base in the U.S. was chosen because emissions are larger in the U.S. than in Europe, and it would hardly be feasible to offset the median American's loss by taxing only the top 1%.

⁵The 95% confidence intervals are [52.4%, 55.9%] in the U.S. and [74.2%, 77.2%] in Europe. The average support is computed with survey weights, employing weights based on quota variables, which exclude vote. Another method to reweigh the raw results involves running a regression of the support for the GCS

support for NR is very similar: 56% and 73% respectively (see Figure S1). Appendix F examines the sociodemographic determinants of support for the GCS as well as the beliefs correlated with the support for a global tax on GHG financing a global basic income. The strongest correlates are political leaning, trust in the government and perceptions that the policy is effective at reducing emissions or in one's self-interest.

The Global Climate Scheme The GCS consists of global emissions trading with emission rights being auctioned each year to polluting firms, and of a global basic income, funded by the auction revenues. Using the price and emissions trajectories from the report by Stern & Stiglitz (2017), and in particular a carbon price of \$90/tCO₂ in 2030, we estimate that the basic income would amount to \$30 per month for every human over the age of 15 (see details in Appendix E). We describe the GCS to the respondents as a "climate club" and we specify its redistributive effects: The 700 million people with less than \$2/day [in Purchasing Power Parity] would be lifted out of extreme poverty, and fossil fuel price increases would cost the typical person in their country a specified amount (see Appendix D for details). The monthly median net cost is \$85 in the U.S., €10 in France, €25 in Germany, €5 in Spain, £20 in the UK.

2.2.3 Global wealth tax

Consistent with the results of the global survey, a "tax on millionaires of all countries to finance low-income countries" garners absolute majority support of over 67% in each country, only 5 p.p. lower than a national millionaires tax overall (Figure 2). In random subsamples, we inquire about respondents' preferences regarding the redistribution of revenues from a global tax on individual wealth exceeding \$5 million, after providing information on the revenue raised by such a tax in their country compared to low-income countries.⁶ We ask certain respondents ($n = 1,283$) what percentage of global tax revenues

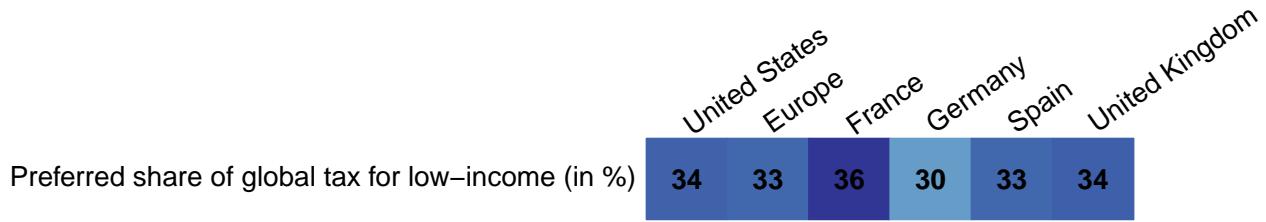

on sociodemographic characteristics (including vote) and multiplying each coefficient by the population frequencies. This alternative approach yields similar figures: 76% in Europe and 52% or 53% in the U.S. (depending on whether individuals who did not disclose their vote are classified as non-voters or excluded). Notably, the average support excluding non-voters is 54% in the U.S.

⁶A 2% tax on net wealth exceeding \$5 million would annually raise \$816 billion, leaving unaffected 99.9% of the world population. More specifically, it would collect €5 billion in Spain, €16 billion in France, £20 billion in the UK, €44 billion in Germany, \$430 billion in the U.S., and \$1 billion collectively in all low-income countries (28 countries, home to 700 million people).

Figure S1: [For Supplementary Material, except first row to be included in Figure 2] Support for the GCS, NR and the combination of GCS, NR and C.
 (p. 92, Questions 20, 22, 35, 36, and 26).

	United States	Europe	France	Germany	Spain	United Kingdom
Global climate scheme (GCS)	54	76	80	71	81	74
National redistribution scheme (NR)	56	73	77	66	79	75
National climate policy + GCS + NR	52	74	79	69	81	70

Figure S2: [For Supplementary Material] Percent of global wealth tax that should finance low-income countries (*mean*). (Question 37)

should be pooled to finance low-income countries. In each country, at least 88% of respondents indicate a positive amount, with an average ranging from 30% (Germany) to 36% (U.S., France) (Figure S2). To other respondents ($n = 1,233$), we inquire whether they would prefer each country to retain all the revenues it collects or that half of the revenues be pooled to finance low-income countries. Approximately half of the respondents opt to allocate half of the tax revenues to low-income countries.

2.2.4 Other global policies

We also assess support for other global policies (Figure 2). Most policies garner relative majority support in each country, with two exceptions: the “cancellation of low-income countries’ public debt” and “a maximum wealth limit” for each individual. The latter policy obtains relative majority support in Europe but not in the U.S., despite the cap being set at \$10 billion in the U.S. compared to €/£100 million in Europe. Notably,

Figure 2: Relative support for various global policies (percentage of *somewhat* or *strong support*, after excluding *indifferent* answers). (Questions 44 and 45; See Figure S33 for the absolute support.)

	United States	Europe	France	Germany	Spain	United Kingdom
Payments from high-income countries to compensate low-income countries for climate damages	55	71	72	70	79	70
High-income countries funding renewable energy in low-income countries	68	82	82	82	85	81
High-income countries contributing \$100 billion per year to help low-income countries adapt to climate change	60	76	77	79	79	71
Cancellation of low-income countries' public debt	46	53	53	43	62	61
Democratise international institutions (UN, IMF) by making a country's voting right proportional to its population	58	71	69	69	78	72
Removing tariffs on imports from low-income countries	62	73	58	73	80	83
A minimum wage in all countries at 50% of local median wage	63	80	80	78	81	83
Fight tax evasion by creating a global financial register to record ownership of all assets	62	87	90	86	91	87
A maximum wealth limit of \$10 billion (US) / €100 million (Eu) for each human	46	62	58	62	65	67
National tax on millionaires funding public services	73	85	81	87	89	88
Global tax on millionaires funding low-income countries	69	84	84	84	87	83

climate-related policies enjoy significant popularity, with “high-income countries funding renewable energy in low-income countries” receiving absolute majority support across all surveyed countries. Additionally, relative support for loss and damages compensation, as approved in principle at the international climate negotiations in 2022 (“COP27”), ranges from 55% (U.S.) to 81% (Spain), with absolute support ranging from 41% to 62%.

2.2.5 Foreign aid

We provide respondents with information about the actual amount “spent on foreign aid to reduce poverty in low-income countries” relative to their country’s government spending and GDP. Less than 16% of respondents state that their country’s foreign aid

should be reduced, while 62% express support for increasing it, including 17% who support an unconditional increase (Figure S3). Among the 45% who think aid should be increased under certain conditions, we subsequently ask them to specify the conditions they deem necessary (Figure S4). The three most commonly selected conditions are: “we can be sure the aid reaches people in need and money is not diverted” (73% chose this condition), “that recipient countries comply with climate targets and human rights” (67%), and “that other high-income countries also increase their foreign aid” (48%).⁷ On the other hand, respondents who do not wish to increase their country’s foreign aid primarily justify their view by prioritizing the well-being of their fellow citizens or by perceiving each country as responsible for its own fate (Figure S5). In response to an open-ended question regarding measures high-income countries should take to fight extreme poverty, a large majority of Americans expressed that more help is needed (Figure S46). The most commonly suggested form of aid is financial support, closely followed by investments in education.

We also inquire about the perceived amount of foreign aid. Consistent with prior research (see Appendix A.1.3), most people overestimate the actual amount of foreign aid (Figure S27). We then elicit respondents’ preferred amount of foreign aid, after randomly presenting them with either the actual amount or no information. Most of the respondents who learn the actual amount choose a bracket at least as high as the actual one, and most of those without the information choose a bracket at least as high as the perceived one (Figures S25–S29). Finally, we ask a last question to the respondents who received the information. To those who prefer an increase of foreign aid, we ask how they would finance it: by far, the preferred source of funding is higher taxes on the wealthiest (Figure S30). To those who prefer a reduction, we ask how they would use the funds becoming available: In every country, more people choose higher spending on education or health-care rather than lower taxes (Figure S31).

2.3 Robustness and sincerity of support for the GCS

We use several methods to assess the sincerity of the support for the GCS: a list experiment, a real-stake petition, conjoint analyses, and the prioritization of policies. All methods suggest that the support is either completely sincere, or the share of insincere answers is limited.

⁷It is worth noting that these conditions align closely with the principles of the GCS.

Figure S3: [For Supplementary Material] Attitudes regarding the evolution of [own country] foreign aid. (Question 46)

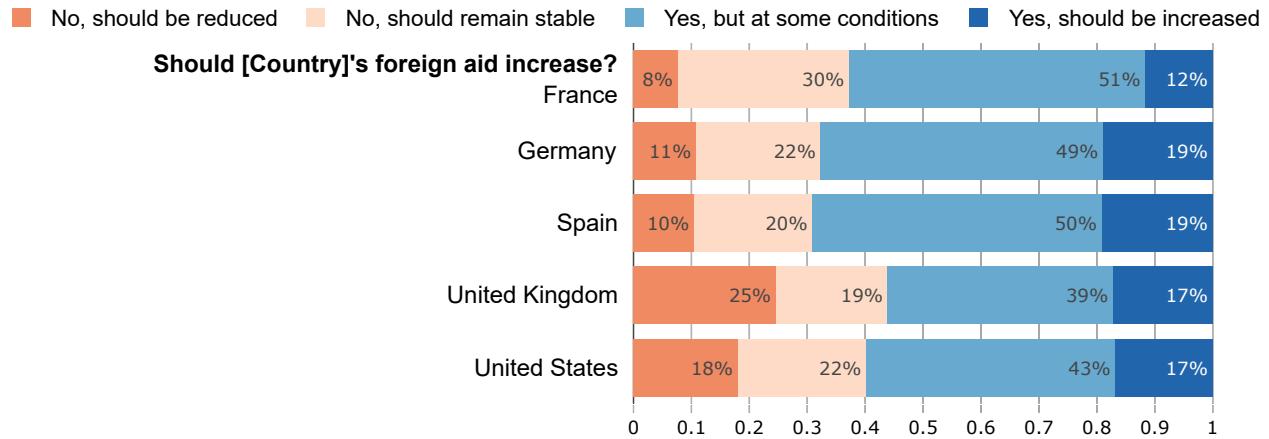

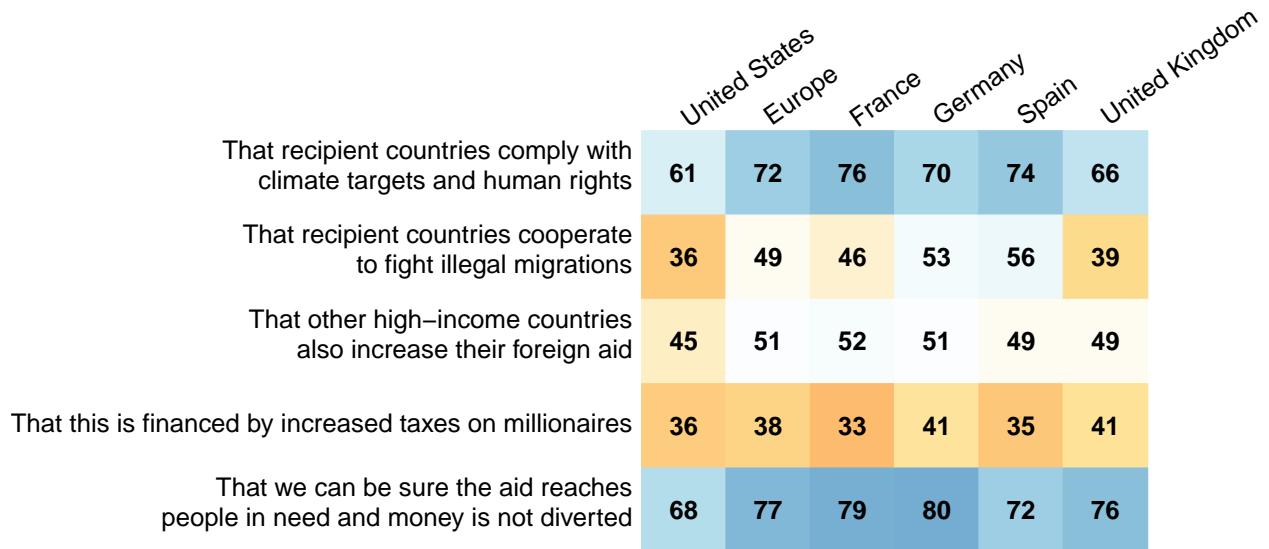

Figure S4: [For Supplementary Material] Conditions at which foreign aid should be increased (in percent). [Asked to those who wish an increase of foreign aid at some conditions.] (Question 47)

2.3.1 List experiment

By asking *how many* policies within a list respondents support and varying the list among respondents, a list experiment allows identifying the tacit support for a policy of interest. The tacit support is estimated as the difference in the average number of policies supported between two groups, whose list differ only by the inclusion of that policy (Hainmueller et al. 2014). For example, say a first subsample faces the list of policies A, B, and C, while a second subsamples faces the list A, B, C, and GCS. We do not need to

Figure S5: [For Supplementary Material] Reasons why foreign aid should not be increased (in percent). [Asked to those who wish a decrease or stability of foreign aid.] (Question 48)

	United States	Europe	France	Germany	Spain	United Kingdom
Aid perpetuates poverty as it makes people feel less responsible for themselves	29	30	31	35	31	24
Aid is not effective as most of it is diverted	40	53	48	57	60	49
Aid is a pressure tactic for high-income countries that prevents low-income countries from developing freely	16	16	15	14	23	13
[Country] is not responsible for what happens in other countries	45	30	28	30	20	37
Charity begins at home: there is already a lot to do to support the [country] people in need	63	63	51	62	71	69

know which policies each respondent support to estimate the average (tacit) support for the GCS, we simply need to compute the difference in the average number of supported policies between the two random subsamples. List experiments have been used to reveal social desirability bias, silencing either racism in the Southern U.S. (Kuklinski et al. 1997) or opposition to the invasion of Ukraine in Russia (Chapkovski & Schaub 2022). In our case, as shown in Table 1, the tacit support for the GCS measured through the list experiment is not significantly lower than the direct stated support.⁸ Hence, we do not find a social desirability bias in our study.

2.3.2 Petition

We ask respondents whether they are willing to sign a petition in support of either the GCS or NR policy. We inform them that the petition results will be sent to the head of state's office, highlighting the proportion of fellow citizens endorsing the respective scheme. Even when framed as a real-stake petition, both policies continue to receive majority support. In the U.S., we find no significant difference between the support in the

⁸We utilize the difference-in-means estimator, and confidence intervals are computed using Monte Carlo simulation with the R package *list* (Imai 2011).

Table 1: Number of supported policies in the list experiment depending on the presence of the Global Climate Scheme (GCS) in the list. The tacit support for the GCS is estimated by regressing the number of supported policies on the presence of the GCS in the list of policies. The social desirability is estimated as the difference between the tacit and stated support, and it is not significantly different from zero even at a 20% threshold (see [Methods](#)).

	Number of supported policies		
	All	U.S.	Europe
List contains: GCS	0.624*** (0.028)	0.524*** (0.041)	0.724*** (0.036)
<i>Support for GCS</i>	0.65	0.542	0.757
<i>Social desirability bias</i>	-0.025	-0.019	-0.033
<i>80% C.I. for the bias</i>	[-0.06; 0.01]	[-0.07; 0.04]	[-0.08; 0.01]
Constant	1.317	1.147	1.486
Observations	6,000	3,000	3,000
R ²	0.089	0.065	0.125

Note:

*p<0.1; **p<0.05; ***p<0.01

real-stake petitions and the simple questions (GCS: $p = .30$; NR: $p = .76$).⁹ In Europe, the petition leads to a comparable lower support for both the GCS (7 p.p., $p = 10^{-5}$) and NR (4 p.p., $p = .008$). While some European respondents are unwilling to sign a petition for policies they are expected to support, this effect is not specific to the GCS, and the overall willingness to sign a real-stake petition remains strong, with 69% expressing support for the GCS and 67% for NR.

2.3.3 Conjoint analyses

In order to assess the public support for the GCS in conjunction with other policies, we conduct a series of conjoint analyses. We ask respondents to make five choices between pairs of political platforms.

The first conjoint analysis suggests that the GCS is supported independently of being complemented by the National Redistribution Scheme and a national climate policy (“Coal exit” in the U.S., “Thermal insulation plan” in Europe, denoted C).¹⁰ For the sec-

⁹Paired weighted *t*-tests are conducted to test the equality in support for a policy among respondents who were questioned about the policy in the petition.

¹⁰Indeed, 54% of U.S. respondents and 74% of European ones prefer the combination of C, NR and the

ond analysis, we split the sample into four random branches.¹¹ The outcome is that there is majority support for the GCS and for C, which are seen as neither complement nor substitute. A minor share of respondents like a national climate policy and dislike a global one, but as many people prefer a global rather than a national policy; and there is no evidence that implementing NR would increase the support for the GCS.

In the third analysis, we present two random branches of the sample with hypothetical progressive and conservative platforms that differ only by the presence (or not) of the GCS in the progressive platform. Table 2 shows that a progressive candidate would not significantly lose voting share by endorsing the GCS in any country, and may even gain 11 p.p. ($p = .005$) in voting intention in France. Though the level of support for the GCS is significantly lower in swing States (at 51%) that are key to win U.S. elections, the electoral effect of endorsing the GCS remains non-significantly different from zero (at +1.2 p.p.) in these States.¹²

Table 2: Preference for a progressive platform depending on whether it includes the GCS or not. (Question 28)

	Prefers the Progressive platform					
	All	United States	France	Germany	UK	Spain
GCS in Progressive platform	0.028*	0.029	0.112***	0.015	0.008	-0.015
	(0.014)	(0.022)	(0.041)	(0.033)	(0.040)	(0.038)
Constant	0.623	0.604	0.55	0.7	0.551	0.775
Observations	5,202	2,619	605	813	661	504
R ²	0.001	0.001	0.013	0.0003	0.0001	0.0003

Note: Simple OLS model. The 14% of *None of them* answers have been excluded from the regression samples. GCS has no significant influence on them. * $p < 0.1$; ** $p < 0.05$; *** $p < 0.01$.

Our last two analyses make respondents choose between two random platforms. In

GCS to the combination of C and NR alone, indicating similar support for the GCS conditional on NR and C than for the GCS alone (Figure S15).

¹¹Results from the first branch show that the support for the GCS conditional on NR, at 55% in the U.S. ($n = 757$) and 77% in Europe ($n = 746$), is not significantly different from the support for the GCS alone. This suggests that rejection of the GCS is not driven by the cost of the policy on oneself. The second branch shows that the support for C conditional on NR is somewhat higher, at 62% in the U.S. ($n = 751$) and 84% in Europe ($n = 747$). However, the third one shows no significant preference for C compared to GCS (both conditional on NR), neither in Europe, where GCS is preferred by 52% ($n = 741$) nor in the U.S., where C is preferred by 53% ($n = 721$). The fourth branch shows that 55% in the U.S. ($n = 771$) and 77% in Europe ($n = 766$) prefer the combination of C, NR and the GCS to NR alone.

¹²We define swing states as the 8 states with less than 5 p.p. margin of victory in the 2020 election (MI, NV, PA, WI, AZ, GA, NC, FL). The results are robust to using the 3 p.p. threshold (that excludes FL) instead.

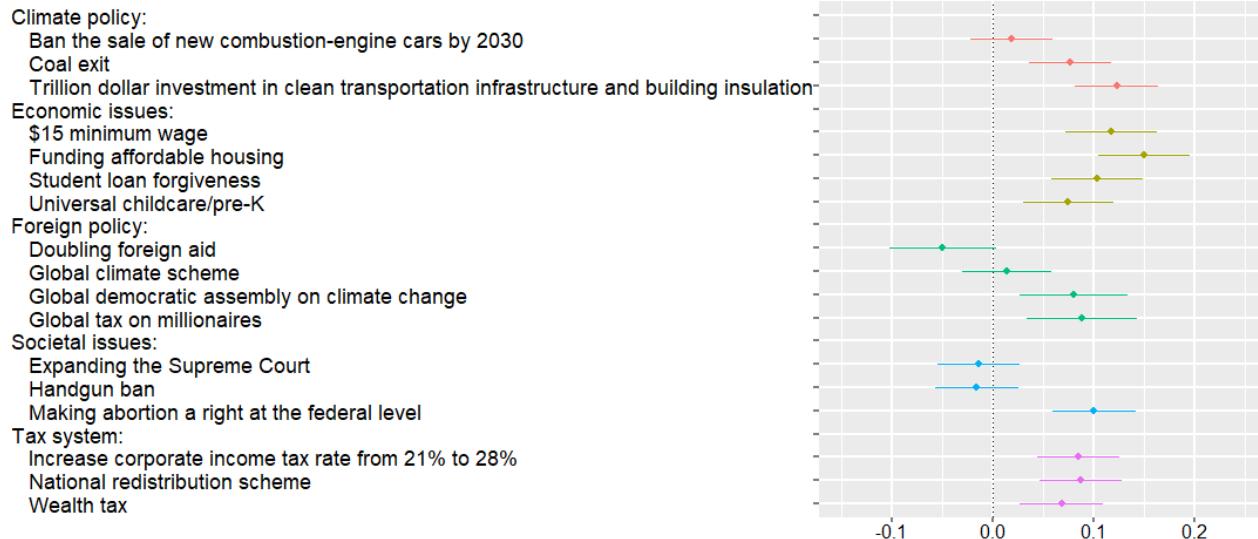

Europe, respondents are prompted to imagine that a left or center-left coalition will win the next election and are asked what platform they would prefer that coalition to have campaigned on. In the U.S., the question is framed as a hypothetical duel in a Democratic primary, and asked only to non-Republicans ($n = 2,218$), i.e. the respondents who declare as political affiliation *Democrat*, *Independent*, *Non-Affiliated* or *Other*. In the fourth analysis, a policy (or an absence of policy) is randomly drawn for each platform in each of five categories: *economic issues*, *societal issues*, *climate policy*, *tax system*, *foreign policy* (Figure S6).

Except for the category *foreign policy*, which features the GCS 42% of the time, the policies are prominent progressive policies and they are drawn uniformly. In the UK, Germany, and France, a platform is about 9 to 13 p.p. more likely to be preferred if it includes the GCS rather than no foreign policy.¹³ This effect is between 1 and 4 p.p. and no longer significant in the U.S. and in Spain. Moreover, a platform that includes a global tax on millionaires rather than no foreign policy is 5 to 13 percentage points (p.p.) more likely to be preferred in all countries (the effect is significant and at least 9 p.p. in all countries but Spain). Similarly, a global democratic assembly on climate change has a significant effect of 8 to 12 p.p. in the U.S., Germany, and France. These effects are large, and not far from the effects of the policies most influential on the platforms, which range between 15 and 18 p.p. in most countries (and 27 p.p. in Spain), and all relate to improved public services (in particular healthcare, housing, and education).

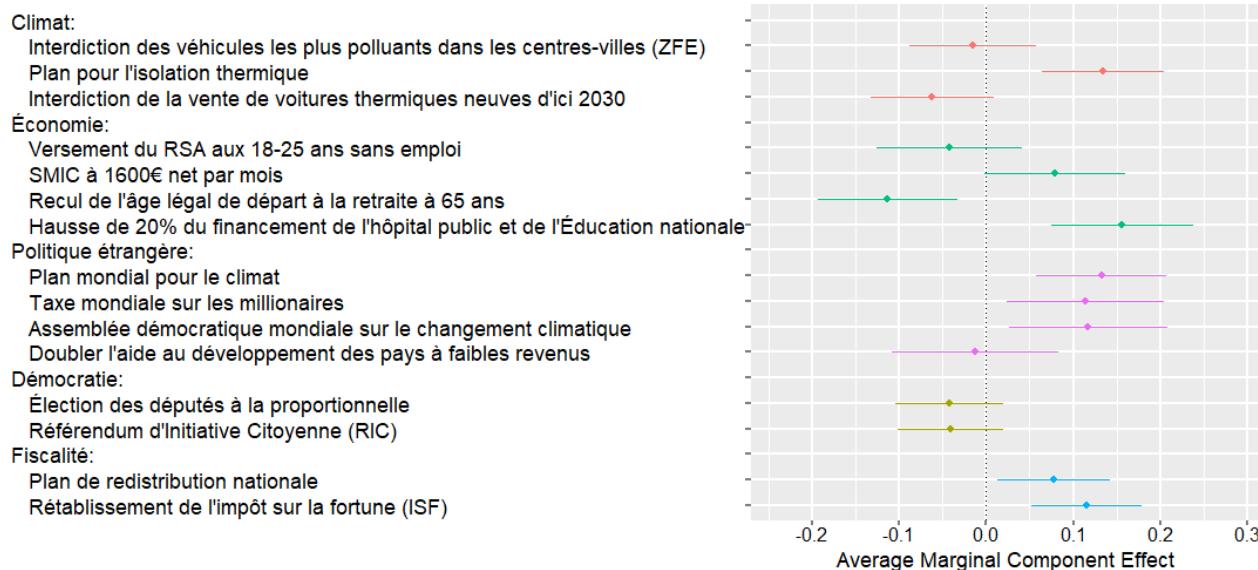

¹³This is the Average Marginal Component Effect computed following Hainmueller et al. (2014).

Figure S6: [For Supplementary Material] Effects of the presence of a policy (rather than none from this domain) in a random platform on the likelihood that it is preferred to another random platform. (See English translations in Figure S16; Question 29)

(a) U.S. (Asked only to non-Republicans)

(b) France

(c) Germany

Klimaschutz:

- Verpflichtende Solaranlagen auf allen geeigneten Dächern
- Plan zur Wärmedämmung
- Verbot des Verkaufs von Neuwagen mit Verbrennungsmotor bis 2030

Wirtschaftspolitik:

- Erhöhung des Regelsatzes des Bürgergelds auf bis zu 600€ pro Monat
- Bürgerversicherung als gerechtere Sozialversicherung
- Staatschuldenquote auf unter 60% reduzieren
- Investitionen für Gigabit-Netzwerke bereitstellen

Außenpolitik:

- Globales Klimaprogramm
- Globale Steuer auf Millionäre
- Globale demokratische Versammlung zum Klimawandel
- Verdopplung der Mittel für die Entwicklungshilfe in einkommensschwachen Ländern

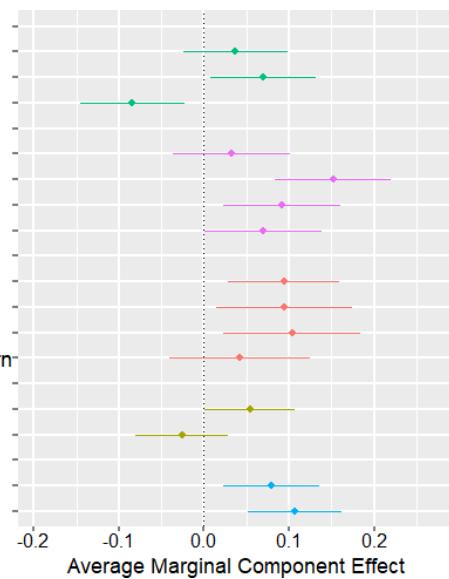

Gesellschaft:

- Volksscheid auf Bundesebene

- Cannabis-Legalisierung

Steuerpolitik:

- Nationales Umverteilungsprogramm
- Die Vermögenssteuer wieder in Kraft setzen

(d) Spain

Política climática:

- 100% de electricidad producida con energías renovables en 2040
- Plan de aislamiento térmico
- Prohibir la venta de coches nuevos con motor de combustión para 2030

Asuntos económicos:

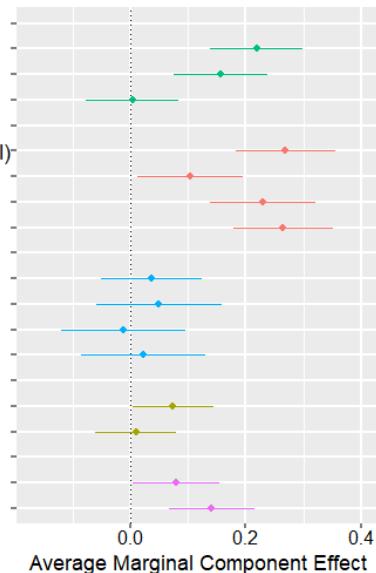

- Más necesidades sanitarias dentro del sistema público (cuidado dental, gafas, salud mental)
- Ingreso Básico Garantizado de 600€ al mes
- Jornada laboral de 34 horas semanales
- Inversión en el sistema educativo y universalización de la educación preescolar

Política exterior:

- Plan climático global
- Impuesto mundial a los millonarios
- Asamblea democrática mundial sobre el cambio climático
- Duplicar la ayuda exterior a los países de renta baja

Asuntos sociales:

- Reformar la ley electoral para hacer el Senado más proporcional
- Abolición de la prostitución
- Plan de redistribución nacional
- Aumentar los impuestos sobre las rentas superiores a 100.000 euros anuales

(e) UK

Climate policy:

- Ban of most polluting vehicles in city centers (low-emission zones)
- Thermal insulation plan
- Ban the sale of new combustion-engine cars by 2030

Economic issues:

- £150 billion to upgrade schools, hospitals, care homes and council houses
- Real Living Wage of £11 per hour for all workers aged 16 and over
- Reduce the average full-time weekly working hours to 32
- Re-establish neighbourhood policing and recruit 2,000 more frontline officers

Foreign policy:

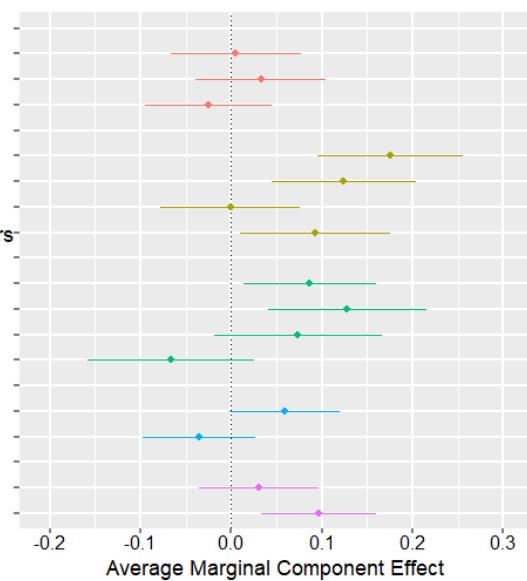

- Global climate scheme
- Global tax on millionaires
- Global democratic assembly on climate change
- Doubling foreign aid

Societal issues:

- Strict enforcement of immigration and border legislation
- Legalization of cannabis

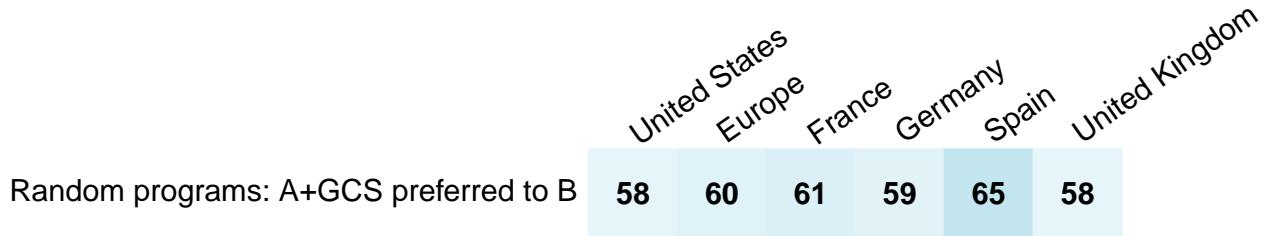

Tax system:

- National redistribution scheme
- Wealth tax

The fifth analysis draws random platforms similarly, except that candidate A's platform always contains the GCS while B's includes no foreign policy. In this case, A is chosen by 60% in Europe and 58% in the U.S. (Figure S7). Overall, taking the U.S. as an example, our conjoint analyses indicate that a candidate at the Democratic primary would have more chances to obtain the nomination by endorsing the GCS, and this endorsement would not penalize her or him at the presidential election. This result reminds the finding that 12% of Germans shift their voting intention from SPD and CDU/CSU to the Greens and the Left when they are told that the latter parties support global democracy (Ghassim 2020).

Figure S7: [For Supplementary Material] Influence of the GCS on preferred platform: Preference for a random platform A that contains the Global Climate Scheme rather than a platform B that does not (in percent). (Question 30; in the U.S., asked only to non-Republicans.)

2.3.4 Prioritization

Towards the end of the survey, we ask respondents to allocate 100 points among six randomly selected policies from the previous conjoint analyses, using sliders. The instruction was to distribute the points based on their level of support, with a higher allocation indicating greater support for a policy. As a result, the average support across policies is 16.67 points. In each country, the GCS ranks in the middle of all policies or above, with an average number of points from 15.4 in the U.S. to 22.9 in Germany.

Interestingly, in Germany, the most prioritized policy is the global tax on millionaires, while the GCS is the second most prioritized policy. The global tax on millionaires consistently ranks no lower than fifth position (out of 15 or 17 policies) in every country, garnering an average of 18.3 points in Spain to 22.9 points in Germany.

This question sheds light on a potential discrepancy between the policy priorities of the public and those enacted by legislators. For instance, while the European Union and California have enacted plans to phase out new combustion-engine cars by 2035, the proposal to “ban the sale of new combustion-engine cars by 2030” emerged as one of the

three least prioritized policies in each country, with an average allocation of 7.8 points in France to 11.4 points in the UK.

2.3.5 Pros and Cons

We survey respondents to gather their perspectives on the pros and cons of the GCS, utilizing either an open-ended or a closed question. In the closed question format, respondents tend to consider every argument as important in determining their support or opposition to the GCS (see Figure S17). Notably, the least important aspect was the negative impact on their household, with 60% in Europe ($n=1,505$) and 75% in the U.S. ($n=493$) finding it important. The most important elements differ between Europe and the U.S. In Europe, the key factors are the GCS's potential to limit climate change and reduce poverty in low-income countries, both deemed important by 85% of respondents. In the U.S., having sufficient information about the scheme ranks highest at 89%, followed by its potential to foster global cooperation at 82%. However, due to the limited variation in the ratings for each element, the closed question format is inconclusive (Figure S17).

The open-ended question provides more insights into what people associate with the GCS when prompted to think about it. Analyzing keywords in the responses (automatically translated into English), the most frequently mentioned topics are the international aspect and the environment, each appearing in approximately one-quarter of the answers (see Figure S19). This is followed by discussions on the effects of the GCS on poverty and prices, each mentioned by about one-tenth of the respondents. We also manually classified each answer into different categories (see Figure S18). This exercise confirms the findings from the automatic search: the environmental benefit of the GCS is the most commonly discussed topic, while obstacles to implementation or agreement on the proposal are relatively infrequently mentioned.¹⁴

In the US2 survey, we divided the sample into four random branches. Two branches were presented the pros and cons questions (either in open or closed format) *before* being asked about their support for the GCS or NR. Another branch received information on the actual level of support for the GCS and NR (estimated in US1, see Section 2.5), and one control group received none of these treatments. The objective of this “pros and cons treatment” was to simulate a “campaign effect”, which refers to the shift in opinion

¹⁴Moreover, around one in four respondents explicitly cites pros or cons. Few individuals explicitly express support or opposition, and misunderstandings are rare. Only 11% of the responses are empty or express a lack of opinion, though one-quarter are unclassifiable due to the rarity, nonsensical nature, or irrelevance of the conveyed idea.

resulting from media coverage of the proposal. To conservatively estimate the effect of a (potentially negative) campaign, we intentionally included more cons (6) than pros (3). Interestingly, the support for the GCS decreased by 11 p.p. after respondents viewed a list of its pros and cons.¹⁵ Notably, the support also decreased by 7 p.p. after respondents were asked to consider the pros and cons in an open-ended question. Although support remains significant,¹⁶ these results suggest that the public success of the GCS would be sensitive to the content of the debate about it, and subject to the discourse adopted by interest groups.

2.4 Universalistic values

We also elicit underlying values, to test whether broad values are consistent with people's support for specific policies. When we ask respondents which group they defend when they vote, 20% choose "sentient beings (humans and animals)," 22% choose "humans," 33% select their "fellow citizens" (or "Europeans"), 15% choose "My family and myself," and the remaining 10% choose another group (mainly "My State or region" or "People sharing my culture or religion"). The first two categories, representing close to one out of two people, can be described as universalist in their vote. Notably, a majority of left-wing voters can even be considered universalist voters (see Figure S47 for main attitudes by vote).

When asked what their country's diplomats should defend in international climate negotiations, only 11% prefer their country's "interests, even if it goes against global justice." In contrast, 30% prefer global justice (with or without consideration of national interests), and the bulk of respondents (38%) prefer their country's "interests, to the extent it respects global justice."

Furthermore, when we ask respondents to assess the extent to which climate change, global poverty, and inequality in their country are issues, climate change is generally viewed as the most significant problem (with a mean score of 0.59 after recoding answers between -2 and 2). This is followed by global poverty (0.42) and national inequality (0.37).

Finally, we conduct a lottery experiment to elicit universalistic values. Respondents

¹⁵Surprisingly, the support for National Redistribution also decreased by 7 p.p. following the closed question about the GCS. This suggests that some individuals may lack attention and confuse the two policies, or that contemplating the pros and cons alters the mood of some people, moving them away from their initial positive impression.

¹⁶Despite some significant effects of pondering the pros and cons, approximately half of the Americans express support for the GCS across all treatment branches (see Table S2).

were automatically enrolled in a lottery with a \$100 prize and had to choose the proportion of the prize they would keep for themselves versus give to a person living in poverty. The charity donation is directed either to an African individual or a fellow citizen, depending on the respondent's random assignment. In Europe, we observe no significant variation in the willingness to donate based on the recipient's origin. In the U.S., the donations to Africans are 3 p.p. lower (with an average donation of 34%), but the slightly lower donations to Africans are entirely driven by Trump voters and non-voters (Table S3).

Overall, answers to these broad value questions are consistent with half of Americans and three quarters of Europeans supporting global policies like the GCS: people are almost as much willing to give to poor Africans than to poor fellow citizens, find that global issues are among the biggest problems, almost half of them are universalist when they vote, and most of them wish that their diplomats take into account global justice.

2.5 Second-order Beliefs

To explain the strong support for the GCS despite its absence from political platforms and public debate, we hypothesized pluralistic ignorance, i.e. that the public and policy-makers mistakenly perceive the GCS as unpopular. As a result, individuals might conceal their support for such globally redistributive policies, believing that advocating for them would be futile. However, the evidence for pluralistic ignorance is limited based on an incentivized question about perceived support (Figure S8).

In the case of Americans, their beliefs about the level of support for the GCS are relatively accurate. The mean perceived support is 52% (with quartiles of 36%, 52%, and 68%), which closely aligns with the actual support of 53%. Europeans, on the other hand, underestimate the support by 17 p.p. Nonetheless, 65% of them correctly estimate that the GCS garners majority support, and the mean perceived support is 59% (and quartiles of 43%, 61%, and 74%), compared to the actual support of 76%. Second-order beliefs are equally accurate for NR in the U.S. and similarly underestimated in Europe. Finally, consistent with Americans accurately perceiving the levels of support for the GCS or NR, providing information on the actual level had no significant effect on their support in the US2 survey.

Figure S8: [For Supplementary Material] Beliefs regarding the support for the GCS and NR. (Questions 21 and 23)

	United States	Europe	France	Germany	Spain	United Kingdom
Belief about GCS	52	59	61	56	63	57
Support for the GCS	54	76	80	71	81	74
Belief about NR	55	58	60	53	62	59
Support for NR	56	73	77	66	79	75

3 Discussion

Our point of departure are recent surveys conducted in 20 of the largest countries, as they reveal robust majority support for global redistributive and climate policies, even in high-income countries that would financially lose from them. The results from complementary surveys conducted in the U.S. and four European countries reinforce these findings. We find strong support for global taxes on the wealthiest individuals, as well as majority support for our main policy of interest – the Global Climate Scheme (GCS). The GCS encompasses carbon pricing at a global level through an emissions trading system, accompanied by a global basic income funded by the scheme's revenues. Additional experiments, such as a list experiment and a real-stake petition, demonstrate that the support for the GCS is real. Such genuine support is further substantiated by the prioritization of the GCS over prominent national climate policies and aligned with a significant portion of the population holding universalistic values rather than nationalistic or egoistic ones. Moreover, the conjoint analyses indicate that a progressive candidate would not lose voting shares by endorsing the GCS, and may even gain 11 p.p. in voting shares in France. Similarly, a candidate endorsing the GCS would gain votes in a U.S. Democratic primary, while in Europe, a progressive platform that includes the GCS would be preferred over one that does not.

Having ruled out insincerity and underestimation of fellow citizens' support as potential explanations for the scarcity of global policies in the public debate, we propose alternative explanations. The first two are variations of pluralistic ignorance, and the last

three represent complementary explanations.

First, there may be pluralistic ignorance *among policymakers* regarding universalistic values, support for the GCS, or the electoral advantage of endorsing it. Second, people or policymakers may believe that globally redistributive policies are politically infeasible in some key (potentially foreign) countries like the U.S. Third, political discourse centrally happens at the national level, shaped by national media and institutions such as voting. National framing by political voices may create biases and suppress universalistic values. Fourth, many individuals, including policymakers, may perceive global redistributive policies as ill-defined or technically infeasible, ultimately dismissing them as unrealistic. In particular, policymakers may have insider information about the technical feasibility of such policies. Alternatively, the perception of unrealism may stem from an unawareness of specific proposals. Fifth, just as policy is disproportionately influenced by the economic elites (Gilens & Page 2014; Persson & Sundell 2023), public debate may be shaped by the wealthiest, who have vested interests in preventing global redistribution.

Confirmation of any of these hypotheses would lead to a common conclusion: there exists substantial support for global policies addressing climate change and global inequality, even in high-income countries, and the perceived boundaries of political realism on this issue may soon shift. Uncovering evidence to support the above hypotheses could draw attention to global policies in the public debate and contribute to their increased prominence.

Methods

Data collection. The paper utilizes two sets of surveys: the *Global* survey and the *Complementary* surveys. The *Complementary* surveys consist of two U.S. surveys, *US1* and *US2*, and one European survey, *Eu*. The *Global* survey was conducted from March 2021 to March 2022 on 40,680 respondents from 20 countries (with 1,465 to 2,488 respondents per country). *US1* collected responses from 3,000 respondents between January and March 2023, while *US2* gathered data from 2,000 respondents between March and April 2023. *Eu* included 3,000 respondents and was conducted from February to March 2023. We used the survey companies *Dynata* and *Respondi*. To ensure representative samples, we employed stratified quotas based on gender, age (5 brackets), income (4), region (4), education level (3), and ethnicity (3) for the U.S. We also incorporated survey weights throughout the analysis to account for any remaining imbalances. These weights were constructed using the quota variables as well as the degree of urbanity, and trimmed between 0.25 and 4. By applying weights, the results are fully representative of the respective countries. Results at the European level apply different weights which ensure representativeness of the combined four Eu-

ropean countries. Appendix G confirms that our samples are representative of the population. Appendix I shows that the treatment branches are balanced. Appendix J runs placebo tests of the effects of each treatment on unrelated outcomes. We do not find effects of earlier treatments on unrelated outcomes arriving later in the survey.

Data quality. The median duration is 28 minutes for the *Global* survey, 14 min for *US1*, 11 min for *US2*, and 20 min for *Eu*. To ensure the best possible data quality, we exclude respondents who fail an attention test or rush through the survey (i.e., answer in less than 11.5 minutes in the *Global* survey, 4 minutes in *US1* or *US2*, 6 minutes in *Eu*).

Questionnaires and raw results. The questionnaire and raw results of the *Global* survey can be found in the Appendix of the companion paper (Dechezleprêtre et al. 2022). The raw results are reported in Appendix B¹⁷ while the surveys' structures and questionnaires are given in Appendices C and D. The questionnaires are the same as the ones given *ex ante* in the registration plan (osf.io/fy6gd).

Incentives. To encourage accurate and truthful responses, several questions of the *US1* survey use incentives. For each of the three comprehension questions that follow the policy descriptions, we randomly select and reward three respondents who provide correct answers with a \$50 gift certificate. Similarly, for questions involving estimating support shares for the GCS and NR, three respondents with the closest guesses to the actual values receive a \$50 gift certificate. In the donation lottery question, we randomly select one respondent and split the \$100 prize between the NGO GiveDirectly and the winner according to the winner's choice. In total, our incentives scheme distributes gift certificates (and donations) for a value of \$850. Finally, respondents have an incentive to answer truthfully to the petition question, as they are aware that the results for that question (the share of respondents supporting the policy) will be transmitted to the U.S. President's office.

Data and code availability

All data and code of the *Complementary* surveys as well as figures of the paper are available on github.com/bixiou/global_tax_attitudes. Data and code for the *Global* survey will be made public upon publication.

¹⁷Country-specific raw results are also available as supplementary material files: [US](#), [EU](#), [FR](#), [DE](#), [ES](#), [UK](#).

A Literature review

A.1 Attitudes and perceptions

A.1.1 Population attitudes on global policies

Using representative samples in 125 countries covering 96% of the world's greenhouse gas emissions, Andre et al. (2024) show that 69% of the global population express willingness to contribute 1% of their income to fight global warming. Carattini et al. (2019) test the support for six variants of a global carbon tax on samples in five countries, representative along gender and age. For a given variant, the sample size is about 167 respondents per country. They find over 80% support for any variant in India, between 50% and 65% in Australia, the UK and South Africa, and 43% to 59% in the U.S., depending on the variant. Notably, the support for a global carbon tax funding an equal dividend for each human is close to 50% in high-income countries (e.g., at 44% in the U.S.), consistently with our results from the *Global* survey (see Figure 1). This is another piece of evidence that the support is lower for a tax that would "only" reduce CO₂ emissions than for a quota that would unambiguously achieve the climate target. Using a conjoint analysis in the U.S. and Germany, Beiser-McGrath & Bernauer (2019b) find that the support for a carbon tax increases by up to 50% if it applies to all industrialized countries rather than exclusively to one's own country.

In surveys conducted in Brazil, Germany, Japan, the UK and the U.S., Ghassim (2020) finds support ranging from 55% to 74% for "a global democracy including both a global government and a global parliament, directly elected by the world population, to recommend and implement policies on global issues". Through an experiment, he also finds that, in countries where the government stems from a coalition, voting shares would shift by 8 (Brazil) to 12 p.p. (Germany) from parties who are said to oppose global democracy to parties that supposedly support it. For instance, when Germans respondents were told that (only) the Greens and the Left support global democracy, these parties gained respectively 9 and 3 p.p. in vote intentions, while the SPD and the CDU-CSU each lost 6 p.p. Ghassim (2020) also presents survey results showing strong majorities in favor of the direct election of one's country's UN representative in all 18 surveyed countries. Similarly, in each of 10 countries, there are clear majorities in favor of "a new supranational entity [taking] enforceable global decisions in order to solve global risks" (Global Challenges Foundation 2018). Remarkably, already in 1946, 54% of Americans agreed (while

24% disagreed) that “the UN should be strengthened to make it a world government with the power to control the armed forces of all nations” ([Gallup 1946](#)). Furthermore, in surveys conducted in Argentina, China, India, Russia, Spain, and the U.S., [Ghassim et al. \(2022\)](#) find majority support for UN reforms that would make United Nations’ decisions binding, give veto powers to a few other major countries at the Security Council, or complement the highest body of the UN with a chamber of directly elected representatives.

Relatedly, [Meilland et al. \(2023\)](#) find that both Americans and French people prefer an international settlement of climate justice, even if it encroaches on sovereignty. In a 2013 survey conducted in China, Germany, and the U.S., [Schleich et al. \(2016\)](#) show that over three-quarter of people think that international climate agreements reached so far are not successful and that future agreements are important. In Finland, [Sivonen \(2022\)](#) finds that that support for a carbon tax is higher if implemented at the global level (54%) rather than at the national level (40%).

The results from these specific questions are in line with the answers to more general questions. In each of 36 countries, [ISSP \(2010\)](#) find near consensus that “for environmental problems, there should be international agreements that [their country] and other countries should be made to follow” (overall, 82% agree and 4% disagree). In each of 29 countries, [ISSP \(2019\)](#) uncover near consensus that “Present economic differences between rich and poor countries are too large” (overall, 78% agree and 5% disagree). [Leiserowitz et al. \(2021\)](#) reveal that 66% of Americans support providing “financial aid and technical support to developing countries that agree to limit their greenhouse gas emissions.” [Fehr et al. \(2022\)](#) find that 90% of Germans want some degree of global redistribution.

A.1.2 Population attitudes on climate burden sharing

Despite differences in the description of fairness principles, surveys on burden-sharing rules show consistent attitudes. Or at least, their seemingly contradictory results can be made compatible with the following interpretation: Concerning emissions reductions, most people want that every country engage in strong and collective decarbonization efforts, with a global quota converging to climate neutrality in the medium run. Concerning the financial effort, most people support high-emitting countries paying and low-income countries receiving funding. The most supported rules are those perceived as equitable, in particular an equal right to emit per person.

This interpretation helps to understand the apparent differences between articles that approach burden sharing from different angles: cost sharing (in money terms), effort shar-

ing (in terms of emissions reductions), or resource sharing (in terms of rights to emit). Existing papers adopt either the cost sharing or effort sharing approach, which preclude any country from being a net receiver of funds. Also, by focusing on *either* the financial or the decarbonization effort, these surveys miss the other half of the picture, which can explain why some papers find strong support for the ability-to-pay principle while others find strong support for grandfathering (defined as emissions reductions being the same in every country). The literature follows these approaches to align with the notions used by the UNFCCC. Yet, we argue that the resource sharing approach is preferable for uncovering attitudes, as it unambiguously describes the distributive implications of each rule while achieving an efficient geographical distribution of emissions reductions and explicitly allowing for monetary gains for some countries.

Now, let us summarize the results of the different papers in the light of this clarification. Schleich et al. (2016) find an identical ranking of support for burden-sharing principles in China, Germany, and the U.S.: polluter-pays followed by ability-to-pay, equal emissions per capita, and grandfathering. Note that the authors do not allow for emissions trading in their description of equal *emissions per capita*, which may explain its relatively low support. Yet, the relative support for egalitarianism also depends on how *the other* rules are described. Indeed, Carlsson et al. (2011) find that Swedes prefer that “all countries are allowed to emit an equal amount per capita” rather than options where emissions are reduced based on current or historical emissions, for which it is explicitly stated that high-emitting countries “will continue to emit more than others”. Bechtel & Scheve (2013) find agreement that rich countries should pay more and historical emissions should matter, but that efforts should not be solely borne by wealthy nations. More precisely, their conjoint analysis conducted in France, Germany, the UK, and the U.S. shows that a climate agreement is 15 p.p. more likely to be preferred (to a random alternative) if it includes 160 countries rather than 20, and 5 p.p. less likely to be preferred if “only rich countries pay” compared to other burden-sharing rules: “rich countries pay more than poor”, “countries pay proportional to current emissions” or “countries pay proportional to historical emissions”. In Germany and the U.S., Gampfer et al. (2014) also find stronger support for funding climate action in low-income countries when cost is shared with other countries. Using a choice experiment, Carlsson et al. (2013) find that the least preferred option in China and the U.S. is when low-emitting countries are exempted from any effort. Ability-to-pay is appreciated in both countries and is the preferred option in the U.S., though the preferred option in China is another one that accounts for historical

responsibility. In the U.S. and France, [Meilland et al. \(2023\)](#) find that the most favored fairness principle is that “all countries commit to converge to the same average of total emissions per inhabitant, compatible with a controlled climate change”. Furthermore, in each country, 73% disagree with grandfathering defined as “countries which emitted a lot of carbon in the past have a right to continue emitting more than others in the future”. The study by [Meilland et al. \(2023\)](#) contains many other results: for instance, majorities prefer to hold countries accountable for their consumption-based rather than territorial emissions, and the median choice regarding historical responsibility is to hold a country accountable for its post-1990 emissions (rather than post-1850 or just their current emissions). Finally, in each of 28 (among the largest) countries, [Dabla-Norris et al. \(2023\)](#) find strong majority for “all countries” to the question “Which countries do you think should be paying to reduce carbon emissions?”. When asked to choose between a cost sharing based on *current* vs. *accumulated historic emissions*, a majority prefers *current emissions* in all countries but China and Saudi Arabia (where the two options are close to equally preferred).

(Back to Section [2.2.1](#))

A.1.3 Population attitudes on foreign aid

There is an extensive literature on attitudes towards foreign aid in donor countries. The key findings indicate that most people overestimate the amount of foreign aid and that only a minority wants a cut in foreign aid compared to actual amounts, especially once they become aware of them.

For instance, [PIPA \(2001\)](#) shows that 83% of Americans support a multilateral effort to cut world hunger in half. [PIPA \(2008\)](#) shows that in each of 20 countries, a majority thinks that developed countries “have a moral responsibility to work to reduce hunger and severe poverty in poor countries”, with an average agreement of 81%. In 7 OECD countries, the study finds that at least 75% of respondents are willing to pay for a program to cut hunger in half (at an estimated cost of, e.g., \$50 a year for each American).

? find that perceived aid is overestimated in each of the 24 countries they study, on average by a factor of 7. In most countries, desired aid is larger than perceived aid.¹⁸ They show that individuals in the top income quintile desire aid 0.13 p.p. lower than those in the bottom 40% – which is very close to what we find. By employing a theoretical model and examining correlations between lobbying and actual aid (controlling for desired aid),

¹⁸[Kaufmann et al. \(2012\)](#) offer the best results on desired aid because (as [Hudson & van Heerde \(2012\)](#) criticize), other studies did not take into account misperceptions of actual aid.

they argue that the gap between actual and desired aid stems from the political influence of the rich who defend their vested interests. In [Kaufmann et al. \(2012\)](#), the U.S. is an outlier: desired aid is at the other countries' average (3% of GNI), but as misperceptions are enormous, perceived aid is twice as large as desired aid. Indeed, [Gilens \(2001\)](#) shows that even Americans with high political knowledge misperceive actual aid, and finds that 17% fewer of them want to cut aid when we provide them specific information about the amount of aid. Similarly, [Nair \(2018\)](#) finds that the relatively low support for aid in the U.S. is driven by information on global distribution, as people underestimate their rank by 27 centiles on average and overestimate the global median income by a factor 10.

[Hudson & van Heerde \(2012\)](#) provide a critical review of the literature and show that the strong support for poverty alleviation largely stems from intrinsic altruism. They note that, according to [DFID \(2009\)](#) and [PIPA \(2001\)](#), 47% of British people find that the aid is wasted (mainly due to corruption), while Americans estimate that less than a quarter of the aid reaches those in need, with over half ending up in the hands of corrupt government officials. Despite these perceptions, most people still support aid, suggesting the presence of nonutilitarian motives. Consistent with [Henson et al. \(2010\)](#), [Bauhr et al. \(2013\)](#) find that support for aid is reduced by the perception of corruption in recipient countries. However, this effect is mitigated by the aid-corruption paradox: countries with higher levels of corruption often need more help. [Bodenstein & Faust \(2017\)](#) further show that right-wing Europeans, as well as those who perceive strong corruption in their country, are more likely to agree that recipient countries should "follow certain rules regarding democracy, human rights and governance as a condition for receiving EU development aid." Using a 2002 Gallup survey and the 2006 World Values Survey, and in line with [Bayram \(2017\)](#), [Paxton & Knack \(2012\)](#) show that the main determinants for wanting more aid are trust, left-wing ideology, interest in politics, and being a woman (all positively associated).

(Back to Section [2.2.5](#))

A.1.4 Population attitudes on taxes on the rich

We are not aware of any previous survey on a global wealth tax,¹⁹ though surveys consistently show strong support for national wealth taxes. In a comprehensive survey conducted in the UK, [Rowlingson et al. \(2021\)](#) show that a wealth tax is the preferred option for raising revenues. Only 8% of respondents state that total net wealth should not

¹⁹We did not find any using the combination of "survey" or "attitudes" with "wealth tax" or "global wealth tax" in Google Scholar.

be taxed (with little differences between Labour and Conservative voters). The study also finds that the preferred design would be a 1% or 3% tax on net wealth above £1 million. By asking how much taxes per year should a person with a certain income and wealth level pay, [Fisman et al. \(2017\)](#) finds that the average American favors a 0.8% linear tax rate on unspecified wealth up to \$2 million (the highest wealth level tested), and a 3% linear rate on inherited wealth. Through a conjoint analysis conducted in three high-income countries, [Schechtl & Tisch \(2023\)](#) find widespread support for a wealth tax (from 78% in the U.S. to 86% in Germany and the UK), with a preference for an exemption threshold set at \$/€1 million (rather than 500,000 or 2 million) with the tax rate and tax unit having little influence on the preferred design. In 21 OECD countries, the [OECD \(2019\)](#) uncovers strong majority support for higher taxes on the rich to support the poor, with nearly 70% overall agreement and less than 20% disagreement. [Isbell \(2022\)](#) finds similarly high level of support in 34 African countries. In the UK, [Patriotic Millionaires \(2022\)](#) find 69% support (and 7% opposition) for a 1.1% tax on wealth in excess of £10 million. In the U.S., [Americans for Tax Fairness \(2021\)](#) find that 67% to 71% of the respondents support to “raise taxes for those earning more than \$400,000 a year”, “raise the income tax rate for those earning over \$1 million a year by 10 percentage points”, or “apply a 2% tax on an individual’s wealth above \$50 million each year, and 3% on wealth above \$1 billion”.

A.1.5 Population attitudes on ethical norms

As argued by [Nybørg et al. \(2016\)](#), social norms can be the solution to the collective action problem. As such, universalistic values and free-riding attitudes are key.

Universalism Various studies have examined the concept of global identity (see [Reysen & Katzarska-Miller \(2018\)](#) for a review). In the 2005-2008 wave of the World Values Survey, [Bayram \(2015\)](#) notes that “78% of the participants in 57 countries see themselves as citizens of the world”, though the [2017-2022 wave](#) reveals that more people feel close to their town, region or country than to the world. [Enke et al. \(2023a\)](#) measure universalism at the U.S. district level using donation data, and find that a district’s universalism predicts electoral outcomes better than its income or education level. To measure universalism at the individual level, [Enke et al. \(2023c\)](#) ask American respondents to split \$100 between a random stranger and a random person with the same income but closer to them. They distinguish different facets of universalism, and define *foreign universalism* as the inclination to give to a foreigner rather than a fellow citizen. They find a home bias

for most people, which could partly be attributed to concerns about inequality, as the split involves two persons with the same income, with the foreigner most certainly living in a poorer country than the American and thus enjoying a higher social status. That being said, a home bias probably remains even after accounting for concerns about inequality, as 84% of Americans agree that “taking care of problems at home is more important than giving aid to foreign countries” (PIPA 2001). Enke et al. (2023b) also measure universalism and analyze its correlates in 7 countries, and Cappelen et al. (2022) deploy this method in 60 countries. In a lab experiment with students in the U.S., Cherry et al. (2017) show that a substantial share of people prefer policies detrimental to them due to their egalitarian worldview. Waytz et al. (2019) show that left-leaning people exhibit a wider “moral circle”. Jaeger & Wilks (2023) find that judgments of moral concern are equally well explained by characteristics of the judge and the evaluated target.

Free-riding Despite the long-standing explanation of the lack of climate action as a result of free-riding, surveys consistently show that people support climate mitigation action in their own country, even in the absence of such action in other countries. Bernauer & Gampfer (2015) show this for Americans and Indians, who both overestimate their country’s emissions at one third of the global total. Beiser-McGrath & Bernauer (2019a) show this in the U.S. and China using an experimental design. McEvoy & Cherry (2016) show that Americans mostly invoke leadership and morality to justify unilateral climate action. Using a range of methods, Aklin & Mildenberger (2020) show that the empirical evidence for free-riding is not compelling, and that climate inaction can be equally well explained by distributive conflicts. Finally, review of the literature by McGrath & Bernauer (2017) shows that climate attitudes are largely nonreciprocal, and primarily driven by values and perceptions of the policies, rather than by considerations of what other countries do.

A.1.6 Second-order beliefs

Allport (1924) introduced the concept of pluralistic ignorance: a shared misperception concerning others’ beliefs. The concept became notorious when O’Gorman (1975) showed that, towards the end of the civil rights movement, 47% of Americans believed that a majority of white people supported segregation, while only 18% did so. PIPA (2001) has shown that while 75% of Americans are willing to contribute \$50 annually to halve world hunger (the cost of the program), only 32% believed that the majority would share this

willingness. Pluralistic ignorance regarding climate-friendly norms in the United States has been documented by Andre et al. (2022), who further show that correcting the misperceptions would be effective to enhance pro-climate behaviors. Relatedly, Sparkman et al. (2022) show that Americans underestimate the support for climate policies by nearly half, while Drews et al. (2022) document pluralistic ignorance of carbon tax support in Spain. Additionally, Geiger & Swim (2016) show that pluralistic ignorance regarding concern for climate change leads people to self-silence, resulting in reduced discussions on the topic.

A.1.7 Elite attitudes

In a survey of climate negotiators on their preferences in terms of burden-sharing, Lange et al. (2007) uncovers a mix of self-serving bias and support for the egalitarian principle. Dannenberg et al. (2010) elicit climate negotiators' equity preferences and find that regional differences in addressing climate change are driven more by national interests than by different equity concerns. Hjerpe et al. (2011) indicate that voluntary contribution, indicated as willingness to contribute, was the least preferred principle among both negotiators and observers. Three of the four principles for allocating mitigation commitments were recognized widely across the major geographical regions: historical responsibilities, ability-to-pay, and equal per capita emissions. This result is confirmed by Kesternich et al. (2021), who observe tendencies for a more harmonized view among key groups towards the ability-to-pay rule in a setting of weighted burden sharing rules. Mildenberger & Tingley (2019) survey elites (Congress staffers and international relations scholars) as well as the population in U.S. and China. They document pluralistic ignorance of pro-climate attitudes, egocentric bias, and increasing support after beliefs are updated.

A.2 Proposals and analyses of global policy-making

A.2.1 Global carbon pricing

Global carbon pricing is widely regarded by economists as the benchmark climate policy, as it would efficiently correct the carbon emissions externality. For instance, Hoel (1991) shows that an international carbon tax can be designed to simultaneously achieve efficiency and accommodate any distributional objective. Concerning the distributional objective, Grubb (1990), Agarwal & Narain (1991) and Bertram (1992) were the first to advocate for an equal right to emit for each human. As Grubb (1990) states it: "by far the

best combination of long term effectiveness, feasibility, equity, and simplicity, is obtained from a system based upon tradable permits for carbon emissions which are allocated on an adult per capita basis".²⁰ Support for such solution has been renewed ever since (Baer et al. 2000; Blanchard & Tirole 2021; Jamieson 2001; Rajan 2021).

While many endorse the egalitarian allocation of emissions permits, economists also considered this outcome as politically unfeasible. Thus, to preserve the current level of inequalities and to preclude transfers between countries, they adjusted their (integrated assessment) models by assigning more weight to the interest of rich countries (Stanton 2011).

Gollier & Tirole (2015) synthesize the distributional decision with a *generosity* parameter which would allocate emissions permit to countries in proportion to their population if set to one, in proportion to their emissions (on the start date of the policy) if set to zero, and as a mixture of the egalitarian and grandfathering rules if set in between. Using a similar formula in the context of a tax, Cramton et al. (2015) (summarized in MacKay et al. 2015) propose that countries with emissions per capita around the average fix the generosity parameter, so that it is strategically chosen to maximize the tax rate, and to fix the tax rate at the minimum price proposed by participating countries. Negotiations would exclude countries with low ambition beforehand; and the treaty would impose trade sanctions on non-participating countries. ? propose a "dual-track transition to global carbon pricing": an expanding climate club that would integrate existing and new emissions trading systems, and a reorientation of UNFCCC negotiations towards a global carbon price and burden-sharing rules. The IMF (2019) also supports global carbon pricing or, as a first step, a carbon price floor. They propose either differentiated prices among countries or international transfers, and estimate that a price of \$75/tCO₂ in 2030 would be compatible with a 2°C trajectory.

Other authors have put forth more radical proposals. For instance, Weitzman (2017) envisions a World Climate Assembly with proportional representation at the global scale, so that the median (human) voter would choose the carbon price level. To finance an adaptation fund, Chancel & Piketty (2015) propose a global *progressive* carbon tax (or a progressive tax on air tickets as a first step), so that rich people (who are high emitters) contribute more to the public good. Fleurbaey & Zuber (2013) highlight that, given that current emitters are probably richer than future victims of climate change damages, climate policies deserve a *negative* discount rate. In other words, we cannot dissociate the

²⁰By "adult per capita", Grubb (1990) means that permits would be allocated equally among adults.

climate issue from global inequalities, and an ethical response to this issue requires global redistribution.

A.2.2 Climate burden sharing

The literature has discussed different burden-sharing principles (Ringius et al. 2002). While there is no agreement on their definitions as different approaches are used (cost sharing, effort sharing, or resource sharing, see Section A.1.2), we describe here the burden-sharing principles consistently using the resource sharing approach (i.e., allocating emissions rights). For other papers that define or compare different burden-sharing principles, see Leimbach & Giannousakis (2019); Vaillancourt & Waaub (2004); Zhou & Wang (2016).

Equal per capita. The simplest principle is perhaps to allocate each year's global carbon quota based on an equal right to emit per capita, or an equal right to emit for each adult. Implementing this principle would result in large transfers from high-emitting to low-emitting countries.

Grandfathering. In contrast, *grandfathering* entails allocating emissions rights in proportion to current emissions. From the perspective of allocating carbon pricing revenues between countries, grandfathering amounts to each country retaining the revenues it collects. Given that nations are sovereign and have not agreed to share emissions rights, this principle can be considered as the default option against which the other ones can be compared in terms of distributive effects.

Historical responsibilities. At the opposite end of the spectrum is the principle of *historical responsibilities*, which assigns to each country a carbon budget proportional to its population. Countries that have emitted more than the average have accumulated a carbon debt towards countries that have emitted less, which have a carbon credit.²¹

To fully specify this rule, one needs to define a start date for the responsibilities on past emissions and specify how to account for population size. 1990 is often chosen as a start year as it is the date of the first IPCC assessment report, marking the widespread acknowledgment of climate change, though variants include 1972, 1960, 1950 or 1850.²²

²¹It is not clear how these debts would be settled. Approaches could involve carbon removal from the atmosphere, or using a conventional social cost of carbon to monetize them, by crediting (positively or negatively) emissions rights to countries in an international carbon market.

²²Climate equity monitor uses 1850 for example.

Several solutions have been proposed to account for evolving populations, none of which is flawless. Matthews (2015) allocates emissions rights on a given year proportionally to the countries' populations in that year. An alternative is to use fixed populations, such as the populations at the chosen start year (Neumayer 2000), or at a future date such as projected when the global total population will reach 9 billion (Raupach et al. 2014). Fanning & Hickel (2023) convert the projected climate debt up to 2050 into monetary terms in a 1.5°C scenario.

The rationale for using fixed populations is to prevent countries from intentionally increasing their population size to gain more emissions rights. However, this approach treats countries with different demographic trajectories similarly, effectively penalizing countries which grow more than others (if past populations are used) or grow more than expected (if future populations are used). Using current populations like Matthews (2015) also comes with its own problems. Consider two countries having contributed very little to cumulative emissions, with the same emissions per capita but different demographic patterns: country A's population has doubled in the last 30 years, while country B's population has remained stable. Despite the similar present situation, country B would accumulate more carbon credit than country A. Essentially, compensating country B more due to its past population size amounts to compensating the dead although it is future generations who will suffer. That being said, using current populations is likely a more viable solution than relying on fixed populations since, in practice, countries with similar emissions per capita tend to have relatively similar demographic trajectories.

Ability to pay. Another prominent burden-sharing principle is the ability to pay whereby richer countries should contribute more to mitigation efforts. To operationalize this principle, Baer et al. (2008) define *capacity* as the share of global income above an exemption threshold. They use the threshold of \$7,500 per year (in 2005 PPP), which corresponds to the top 28% of the global income distribution. According to this principle, the effort of a country should be proportional to the revenues it would raise with a linear income tax on individual income above \$7,500.

Climate Equity Reference Framework Baer et al. (2008) propose another effort-sharing method, the *Climate Equity Reference Framework* (CERF), which blends the ability to pay principle with their version of historical responsibilities. They define *responsibility* as follows: they determine the mitigation requirement as the emissions gap between the Busi-

ness as Usual scenario from IEA (2007) and a 2°C (with 68-86% probability) scenario. The mitigation requirement is then allocated to countries proportionally to their cumulative emissions (starting in 1990). The emissions right of a country according to their *responsibility* are then determined by its Business as Usual emissions minus its mitigation requirement. A country's emissions right, dubbed its *greenhouse development right* (GDR), is defined using a combination of *capacity* (C) and *responsibility* (R) to allocate the mitigation requirement between countries. This allocation key is called the *Responsibility and Capacity Indicator* (RCI) and defined as $RCI = R^a \cdot C^{1-a}$, with $a = .4$.

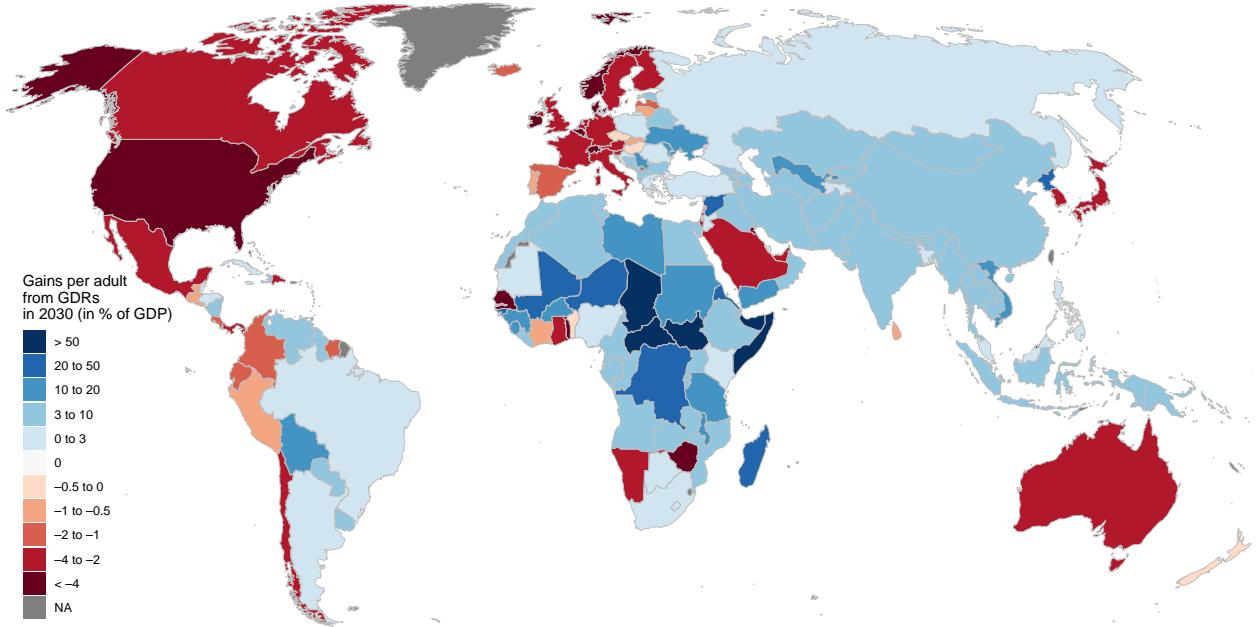

This choice of parameter may seem somewhat arbitrary, but the [EcoEquity calculator](#) allows for a customization all CERF parameters (Holz et al. 2018, 2019). The Climate Action Network has adopted the CERF as its *fair share* framework, though the different national chapters of the organization could not agree on a choice of parameters (Athanasios et al. 2022).²³

The CERF approach was adopted by a prominent network of climate NGOs because it operationalizes the principle of *common but differentiated responsibilities and respective capabilities* recognized by the UNFCCC. However, this approach suffers from three drawbacks. First, its definition of historical responsibility as an effort sharing principle is inconsistent with the principle of an equal right of cumulative emissions per capita, which is a resource sharing principle. For instance, consider a fully decarbonized country that has exhausted *exactly* its cumulative carbon budget. According to the CERF notion of *responsibility*, this country would still be expected to contribute significantly to mitigation efforts due to its relatively high cumulative emissions. Yet, according to the usual definition of the historical responsibility based on an equal right of cumulative emissions p.c., this country would have no liability as it has not exceeded its carbon budget. Second, a country with moderate incomes²⁴ and low historical responsibility would be assigned a relatively low effort, even if its emissions per capita are high. In other words, the CERF approach favors countries that have experienced recent growth. Third, the poorest countries would be granted emissions rights close to the Business as Usual trajectory, as they

²³The U.S. Climate Action Network and the think tank EcoEquity (funded by Tom Athanasiou and late Paul Baer) choose the following parameters: an equal weight for R and C ($a = .5$), their own [business as usual projections](#) of CO₂ emissions based on trends of GDP growth and emissions intensity reduction, a 1.5°C (Low Energy Demand) pathway, 1950 as the start year for responsibility, a gradual inclusion of income to compute *capacity* (which adds complexity to the calculation) from a full exemption of the bottom 70% (\$7,500 per year) linearly to a full inclusion of the top 2% (\$72,211), the inclusion of non-CO₂ gases but not of emissions embodied in trade (i.e. imported emissions) nor LULUCF (land-use).

²⁴Using the above parameters, moderate incomes means few incomes above the global 70th. percentile.

Figure S9: Net gains from the CERF burden-sharing rule in 2030.

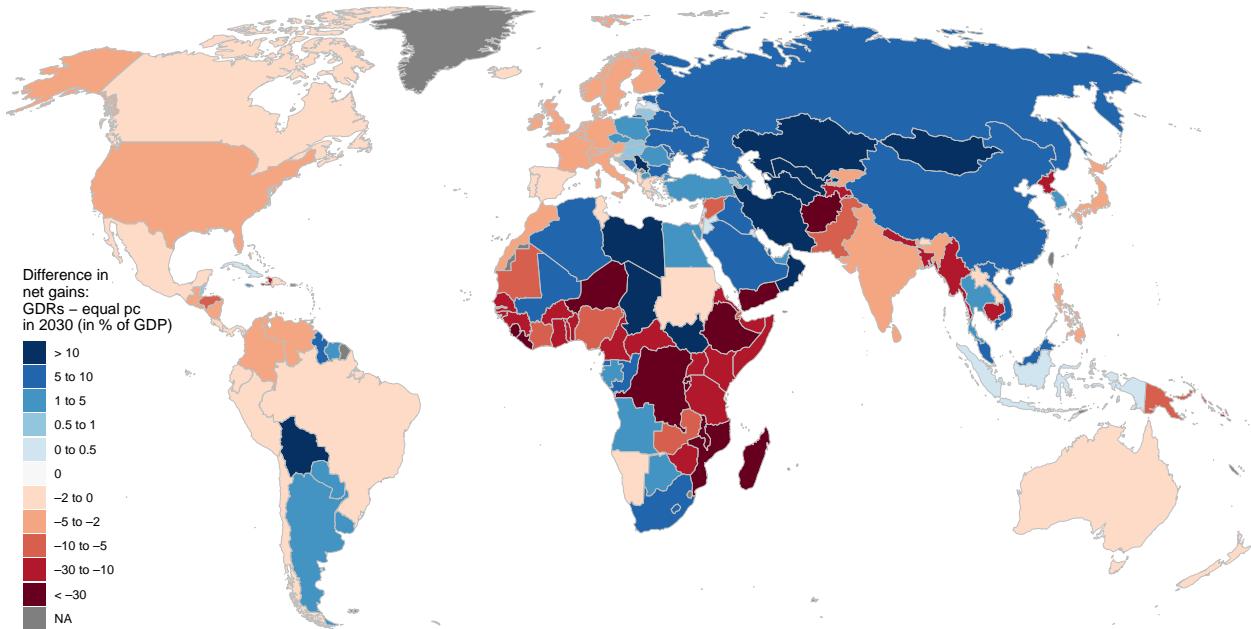

Note: GDRs are calibrated with the preferred parameters of the [U.S. Climate Action Network](#) ([Athanasios et al. 2022](#)) using the Efficiency scenario (2°C with >50% chance) of the Global Energy Assessment ([Johansson et al. 2012](#)) and a price of \$144/tCO₂.

would bear virtually none of the effort. But this trajectory carries the current (unfair) income distribution and amounts to grandfathering. For example, the baseline trajectory for emissions²⁵ in the DRC entail 0.8 tCO₂ p.c. in 2030, which is five times less than the world average emissions right per capita. In this framework, if the DRC were to grow faster than projected in the baseline, it would actually have to pay to the rest of the world for mitigation efforts. This is what is likely to happen to countries like Mexico or Senegal, from our simulation of the net gains of CERF compared to a situation without international transfers (see Figure S9). In contrast, a resource sharing approach based on equal per capita emissions would result in low-income countries receiving emissions rights exceeding their projected trajectories, leading to transfers from high-income countries. By construction, such transfers do not occur in an effort sharing approach like the CERF, implying lower transfers to low-income countries. Compared to an equal right to emit per capita, this method favors countries like China (whose emissions are allowed to remain stable over 2020-2030 instead of a reduction of 35-40%) and penalizes regions like Sub-Saharan Africa and Latin America (see Figure S10).

²⁵The baseline trajectory is computed as the “product of the projected GDP and CO₂ emission intensity”.

Figure S10: Difference between net gains from Greenhouse Development Rights and equal rights per capita.

Note: GDRs are calibrated with the preferred parameters of the [U.S. Climate Action Network](#) ([Athanasios et al. 2022](#)) using the Efficiency scenario (2°C with >50% chance) of the Global Energy Assessment ([Johansson et al. 2012](#)) and a price of \$144/tCO₂.

Contraction and Convergence. Meyer (2004) defines a rule called *contraction and convergence* (C&C), which combines elements of grandfathering and equal per capita approaches. According to C&C, each country is granted (tradable) emissions rights, starting at their current emission level and converging linearly to an equal per capita level at some pre-specified date. The *contraction* part refers to the reduction of total emissions rights in line with the climate objective. When discussed around year 2000, the convergence date was specified between 2020 and 2050. This rule, advocated by the Global Commons Institute (a UK think tank), was on the agenda from COP2 to COP15 (i.e., until Copenhagen, and including in Kyoto), including at Kyoto, and was endorsed by the European Parliament in 1998. More recently, Gignac & Matthews (2015) have shown how C&C can be made consistent with historical responsibilities by computing carbon debts and credits until the convergence date.

Assessments of the NDCs against burden-sharing principles. The regime established by the 2015 Paris agreement to regulate climate change respects none of the burden-

sharing principles and relies instead on voluntary contributions from each country, known as Nationally Determined Contributions (NDCs). A body of literature (reviewed by Höhne et al. 2014) assesses the NDCs against the emissions reduction objective and different burden-sharing principles. To evaluate the NDCs, Gao et al. (2019) examine their emissions projections for 2030 and estimate the resulting increase in temperature. The most recent and comprehensive assessment of NDCs against burden-sharing principles is conducted by van den Berg et al. (2020) (see also Raupach et al. 2014; Robiou du Pont et al. 2016, 2017).

A.2.3 Global redistribution

Addressing global poverty, inequalities, and climate change are central to the universally agreed Sustainable Development Goals (SDG). As highlighted by Bolch et al. (2022), low-income countries often lack sufficient domestic resources to eradicate poverty in the short term, indicating the need for international transfers to rapidly end global poverty. In *Beyond the Welfare State*, Gunnar Myrdal (1960) called for a *welfare world*. In his Nobel lecture, he emphasized the necessity of increasing foreign aid to low-income countries, stating that “The type of marginal foreign aid we have provided, is clearly not enough to meet their barest needs” (Myrdal 1975).

Drawing on the labor theory of value, some economists have argued that global inequalities arise from unequal exchange in international trade (Arghiri 1972). Indeed, the stark disparity in wages between countries implies that one unit of labor exported by an American commands five units of labor embodied in imported goods, whereas Ethiopians need to export 50 units of labor to obtain one unit through imports (Alsamawi et al. 2014; Reyes et al. 2017). Taking stock, Hickel (2017) proposes to globally establish minimum wages at 50% of the local median wage. Hickel (2017) also suggests other solutions against global inequality, which served as inspiration for our questionnaire. These measures include the cancellation of low-income countries’ public debt, fair trade practices (such as eliminating tariffs from high-income countries, reducing patent protections, and reducing farming subsidies in rich countries), initiatives to combat tax evasion (e.g., implementing a global financial register), land reform, and a fair international climate policy.

Piketty (2014) prominently advocates for a progressive wealth tax on a global scale, although he does not specify whether the resulting revenues should fund international transfers.

Kopczuk et al. (2005) compute the optimal linear income tax rates for all countries in

two ways: globally centralized and decentralized (i.e., within each country and without international transfers). They show that the average decentralized rate is 41%. In contrast, the global rate is 62%, which would generate funds to finance a basic income of 250\$/month (higher than the GPD per capita of 73 countries). From a current global Gini index of 0.695, they show that decentralized optimal taxation would only marginally reduce global inequality to 0.69, whereas global taxation would significantly decrease the Gini to 0.25. The study also shows that the existing level of foreign aid can only be rationalized if the U.S. attaches 2,000 less value to a citizen in the poorest countries than to an American citizen (or 1,000 less if half of the transfers are diverted due to corruption).

A.2.4 Basic income

Unconditional cash transfers (UCT) are increasingly seen as an effective way to end extreme poverty. A growing body of evidence from randomized control trials supports this notion: [Gangopadhyay et al. \(2015\)](#) find that UCT outperform a food subsidy; [Haushofer & Shapiro \(2016\)](#) find significant impacts on health, economic outcomes, and psychological well-being; [Egger et al. \(2022\)](#) find large positive spillovers on non-recipient people, and minimal inflation. Reviews of existing research further confirm the positive outcomes of UCT ([Bastagli et al. 2016](#); [Standing 2014](#)).

While the delivery of cash to remote areas and the prevention of fraud is challenging in regions without a proper civil register, the use of mobile phones as banking and biometric identification tools could provide viable solutions ([Harnett 2017](#)). Although many places still lack internet access, satellite internet technology shows promising progress, with some experts suggesting that it could soon become affordable and universally accessible ([Hanson 2016](#)).

A.2.5 Global democracy

The idea of world federalism has a long-standing history, dating back at least to [Kant \(1795\)](#), who argued that a world federation was essential for achieving perpetual peace. International organizations were eventually created to foster peace, though the League of Nations and its successor, the United Nations, never succeeded in avoiding military conflicts. Many have argued that we need stronger and more democratic global institutions, competent to address global challenges such as extreme poverty, climate change, wars, pandemics, or financial stability. Before World War II, feminist and pacifist [Maver-](#)

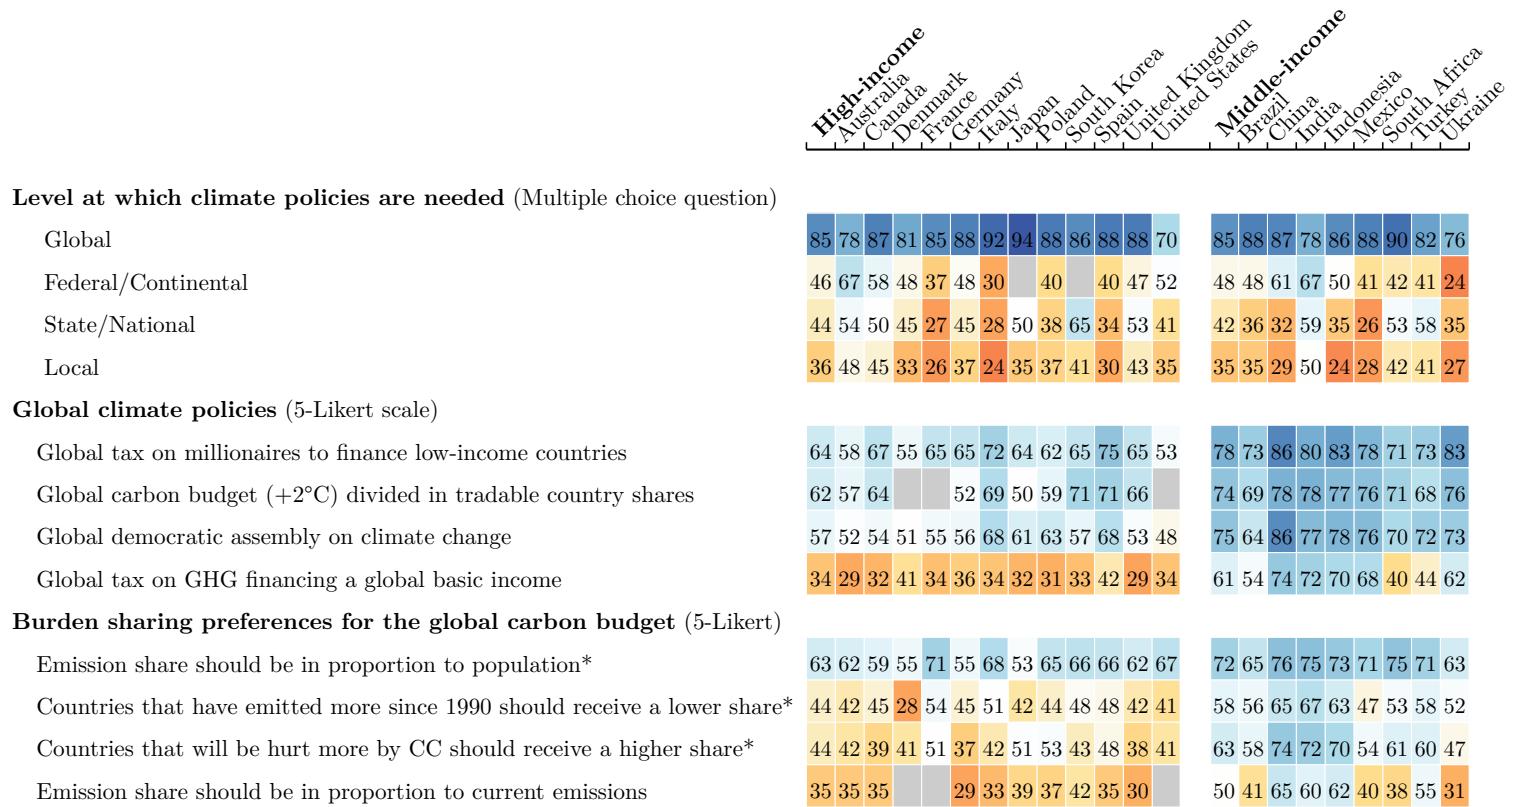

ick Lloyd & Schwimmer (1937) founded the *Campaign for World Government*, advocating for direct representation at the global scale. Einstein (1947) called for the subordination of the UN Security Council to the General Assembly and the direct election of UN delegates. Since 2007, there has been widespread support for a United Nations Parliamentary Assembly (UNPA) from individuals and institutions in over 150 countries, including 1,800 member of parliament, heads of state, as well the European Parliament, the Pan-African Parliament, and the Latin-American Parliament. The UNPA campaign calls for a gradual implementation of a democratic assembly, starting with a consultative assembly composed of members of national parliaments, allowing for the direct election of its members in voluntary countries, and progressing towards a world parliament with binding legislative powers once all members are directly elected (Leinen & Bummel 2018). Besides the UNPA, various scholars have put forward different models of global democracy, ranging from deliberative spaces to a world federation (Archibugi et al. 2011). While the most radical proposals may still be on the horizon, an assembly of random citizens representative of the world population has already been convened. It has produced a joint statement at the COP26 (Global Assembly 2022), and a similar *World Citizens' Assembly* should soon follow.

B Raw results

Country-specific raw results are also available as supplementary material files: [US](#), [EU](#), [FR](#), [DE](#), [ES](#), [UK](#).

Figure S11: Absolute support for global climate policies.

Share of *Somewhat* or *Strongly support* (in percent, $n = 40,680$). The color blue denotes an absolute majority. See Figure 1 for the relative support. (Questions A-I of the global survey.)

*In Denmark, France and the U.S., the questions with an asterisk were asked differently, cf. Question F.

Figure S12: Correct answers to comprehension questions (in percent). (Questions 16-18)

	United States	Europe	France	Germany	Spain	United Kingdom
With NR, typical [country] people win and richest lose	68	73	76	73	73	70
With GCS, typical [country] people lose and poorest humans win	60	68	62	72	67	67
With GCS+NR, typical [country] people neither win nor lose	54	60	63	59	57	61

(b) Keywords found in the open-ended field on the GCS (automatic search ignoring case, in percent).

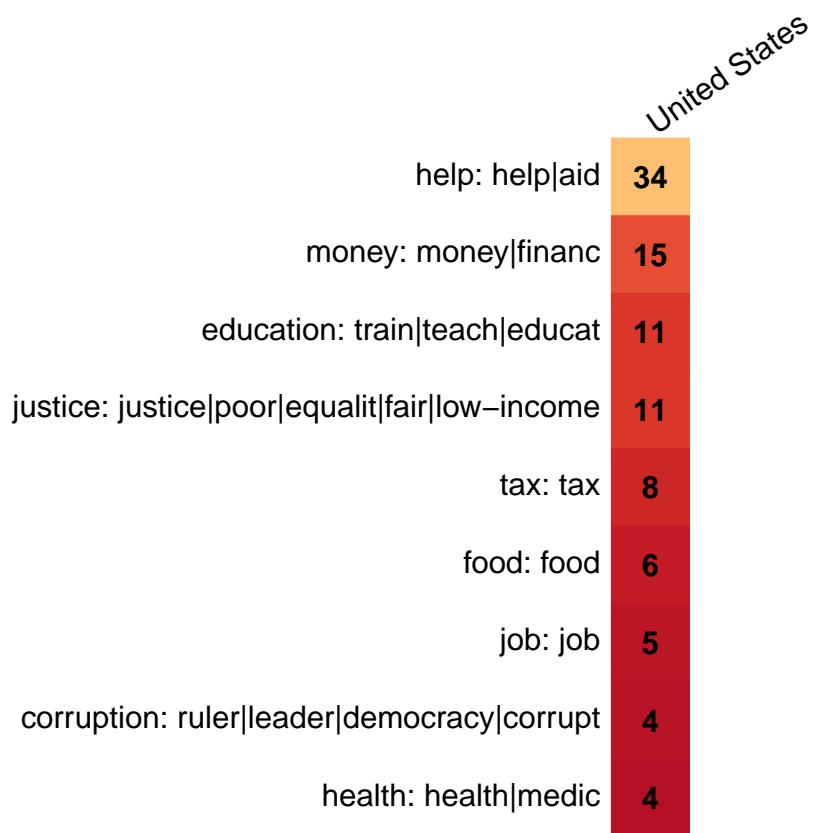

Figure S47: Main attitudes by vote (“Right” spans from Center-right to Far right).
 (Relative support in percent in Questions 20, 35, 45, 46, 49) (Back to Section 2.4)

	Europe Left	Europe PNR/Non-voter	Europe Right	U.S. Left	U.S. PNR/Non-voter	U.S. Right
Support for the GCS	85	72	71	74	53	26
Global tax on millionaires	94	83	76	85	71	40
Sharing half of global tax with low-income countries	61	52	45	55	67	41
A maximum wealth limit of \$10 billion (US) / €100 million (Eu) for each human	73	65	52	62	49	23
High-income countries funding renewable energy in low-income countries	93	79	74	87	70	38
[Country]'s foreign aid should be increased	93	83	72	92	81	48
Universalist	56	48	26	53	49	23

C Questionnaire of the global survey (section on global policies)

- A. At which level(s) do you think public policies to tackle climate change need to be put in place? (Multiple answers are possible) [Figures 1 and S11]
Global; [Federal / European / ...]; [State / National]; Local

- B. Do you agree or disagree with the following statement: “[country] should take measures to fight climate change.”
Strongly disagree; Somewhat disagree; Neither agree nor disagree; Somewhat agree; Strongly agree

- C. How should [country] climate policies depend on what other countries do?
- If other countries do more, [country] should do...
 - If other countries do less, [country] should do...

Much less; Less; About the same; More; Much more

- D. [In all countries but the U.S., Denmark and France] All countries have signed the Paris agreement that aims to contain global warming “well below +2 °C”. To limit global warming to this level, there is a maximum amount of greenhouse gases we can emit globally, called the carbon budget. Each country could aim to emit less than a share of the carbon budget. To respect the global carbon budget, countries that emit more than their national share would pay a fee to countries that emit less than their share.

Do you support such a policy? [Figures 1 and S11]

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

- E. [In all countries but the U.S., Denmark and France] Suppose the above policy is in place. How should the carbon budget be divided among countries? [Figures 1 and S11]

The emission share of a country should be proportional to its population, so that each human has an equal right to emit.; The emission share of a country should be proportional to its current emissions, so that those who already emit more have more rights to emit.; Countries that have emitted more over the past decades (from 1990 onwards) should receive a lower

emission share, because they have already used some of their fair share.; Countries that will be hurt more by climate change should receive a higher emission share, to compensate them for the damages.

F. [In the U.S., Denmark, and France only] To achieve a given reduction of greenhouse gas emissions globally, costly investments are needed. Ideally, how should countries bear the costs of fighting climate change?

- Countries should pay in proportion to their income
- Countries should pay in proportion to their current emissions [Used as a substitute to the equal right per capita in Figure 1]
- Countries should pay in proportion to their past emissions (from 1990 onwards) [Used as a substitute to historical responsibilities in Figure 1]
- The richest countries should pay it all, so that the poorest countries do not have to pay anything
- The richest countries should pay even more, to help vulnerable countries face adverse consequences: vulnerable countries would then receive money instead of paying [Used as a substitute to compensating vulnerable countries in Figures 1 and S11]

Strongly disagree; Somewhat disagree; Neither agree nor disagree; Somewhat agree; Strongly agree

G. Do you support or oppose establishing a global democratic assembly whose role would be to draft international treaties against climate change? Each adult across the world would have one vote to elect members of the assembly. [Figures 1 and S11]
Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

H. Imagine the following policy: a global tax on greenhouse gas emissions funding a global basic income. Such a policy would progressively raise the price of fossil fuels (for example, the price of gasoline would increase by [40 cents per gallon] in the first years). Higher prices would encourage people and companies to use less fossil fuels, reducing greenhouse gas emissions. Revenues from the tax would be used to finance a basic income of [\$30] per month to each human adult, thereby lifting the 700 million people who earn less than \$2/day out of extreme poverty. The average

[American] person would lose a bit from this policy as they would face [\$130] per month in price increases, which is higher than the [\$30] they would receive.

Do you support or oppose such a policy? [Figures 1 and S11]

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

- I. Do you support or oppose a tax on all millionaires around the world to finance low-income countries that comply with international standards regarding climate action? This would finance infrastructure and public services such as access to drinking water, healthcare, and education. [Figures 1 and S11]
Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

D Questionnaire of the complementary surveys

Below, we provide the generic questionnaire (based on the U.S. version), which roughly corresponds to the *Eu* questionnaire as well as the combination of the *US1* and *US2* questionnaire. The main difference between Europe and the U.S. is that we split the *US2* sample into four random branches to include some treatments before the Section D on the GCS. Besides the control group, the treatments are: information regarding the support of Americans for the GCS and NR, an open-ended field, and a closed question on the pros and cons of the GCS. The pros and cons of the GCS are also asked in *Eu* (likewise, either as an open-ended field or a question), but only in Section D, after the support.

At each section or question, square brackets specify in which questionnaires it is present (*US1*, *US2* and/or *Eu*) as well as country specificities. Figures S48-S50 display the structure of each questionnaire. Each treatment randomization is independent. Qualtrics and Word versions of the questionnaires in each language are available on our [public repository](#), together with a spreadsheet that summarizes country specificities and our sources.

Figure S48: *Eu* survey structure

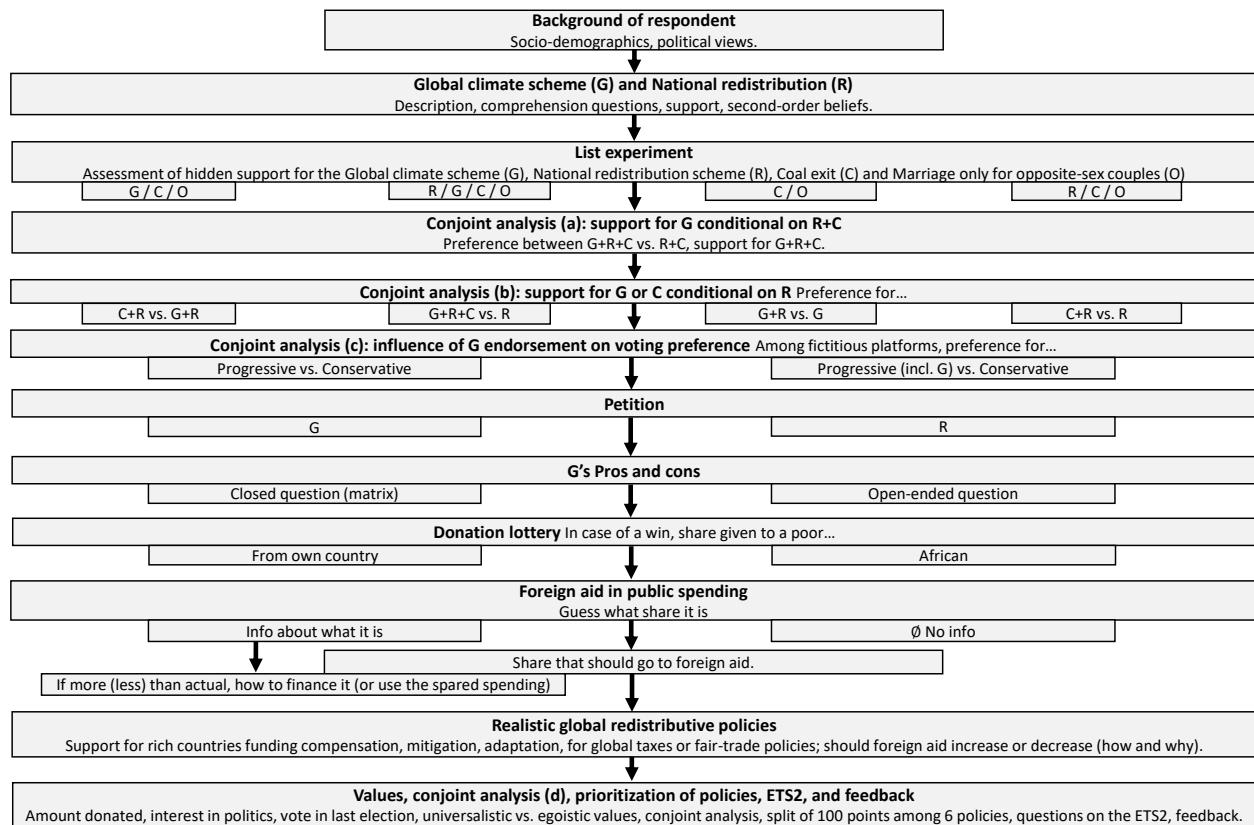

Figure S49: US1 survey structure

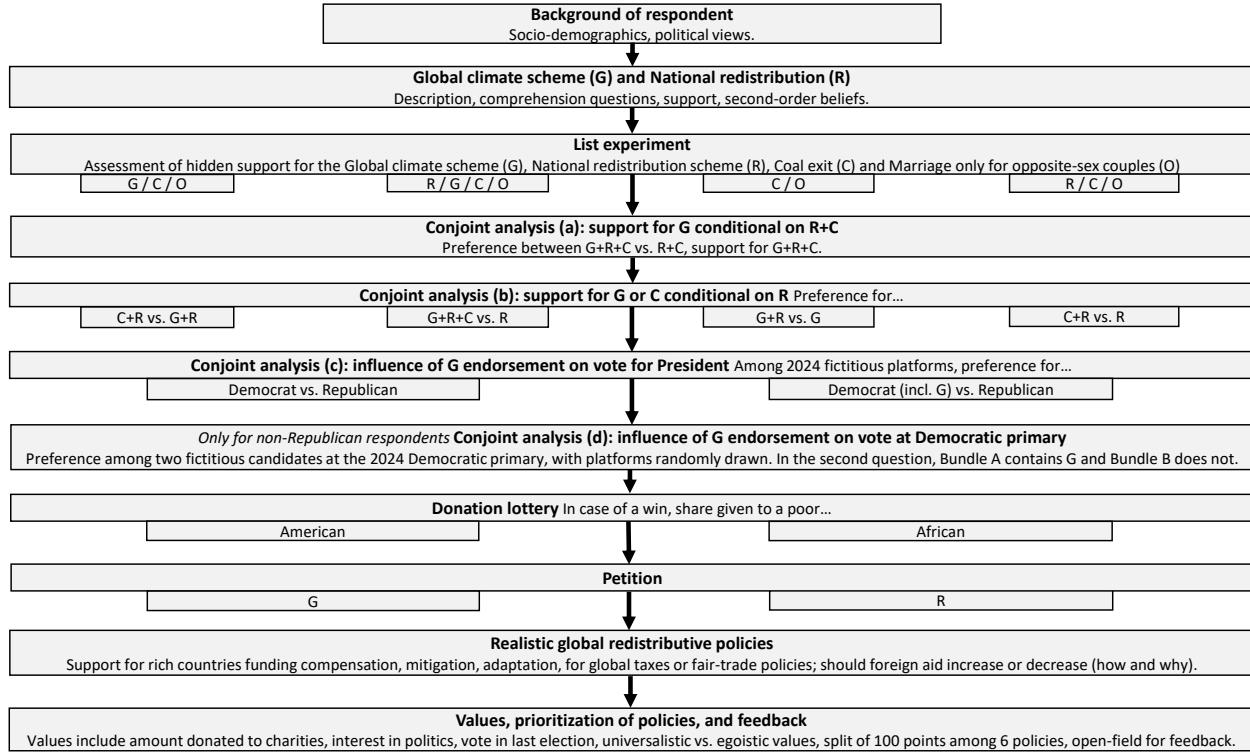

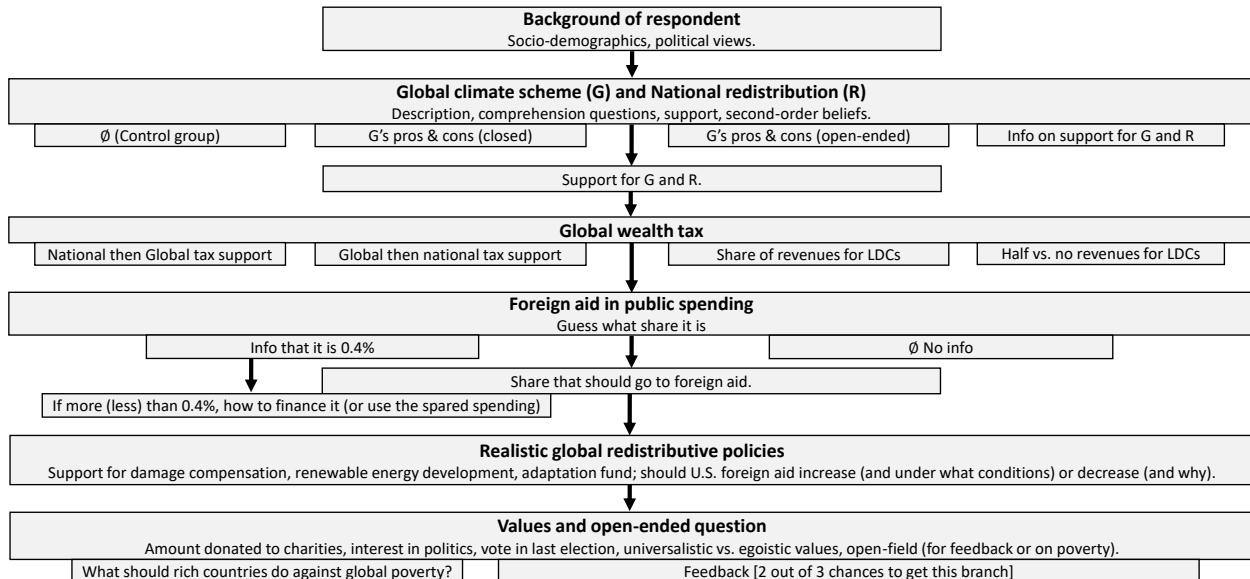

Figure S50: US2 survey structure

[Eu, US1, US2] Socio-demographic characteristics

1. Welcome to this survey!

This survey is **anonymous** and is conducted **for research** purposes on a representative sample of [1,000 British people].

It takes [US1, US2: 10 to 15 min; Eu: around **20 min**] to complete.

The survey contains lotteries and awards for those who get the correct answer to some understanding questions.

If you are attentive and lucky, **you can win up to** [US1, Eu: \$350; US2: \$150] in points. ([See terms and conditions](#)).

Please answer every question carefully.

Do you agree to participate in the survey?

Yes; No

2. What is your gender?

Woman; Man; Other

3. How old are you?

Below 18; 18 to 20; 21 to 24; 25 to 29; 30 to 34; 35 to 39; 40 to 44; 45 to 49; 50 to 54; 55 to 59; 60 to 64; 65 to 69; 70 to 74; 75 to 79; 80 to 84; 85 to 89; 90 to 99; 100 or above

4. [Eu] In which country do you live?

France; Germany; Spain; United Kingdom; Other

5. What is your ZIP code? [UK: What is your Outcode (the left part of your postcode, e.g. if your postcode is N7 8H7, just enter N7)?]

6. Do you live with your partner (if you have one)?

Yes; No

7. How many people are in your household? The household includes: you, the members of your family who live with you, and your dependants.

1; 2; 3; 4; 5 or more

8. [Eu] How many children below 14 live with you?
1; 2; 3; 4 or more
9. [US1, US2] What race or ethnicity do you identify with? (Multiple answers are possible)
White; Black or African American; Hispanic; Asian; American Indian or Alaskan Native; Native Hawaiian or Pacific Islander; Other: {open field}; Prefer not to say
10. What is the [US1, US2: annual; Eu: monthly] gross income of your household (before withholding tax)? This includes all income: wages, self-employment earnings, Social Security benefits, pensions, investment income, welfare payments, and income from other sources.
[US1, US2: Items based on household total income deciles and quartiles, namely:
Less than \$20,000; between \$20,001 and \$35,000; between \$35,001 and \$42,000; between \$42,001 and \$50,000; between \$50,001 and \$65,000; between \$65,001 and \$82,000; between \$82,001 and \$103,000; between \$103,001 and \$130,000; between \$130,001 and \$145,000; between \$145,001 and \$165,000; between \$165,001 and \$250,000; More than \$250,000; I prefer not to answer;
Eu: custom thresholds, taking into account household composition Questions 6-8, and corresponding to the country's deciles and quartiles of standard of living, cf. the sheet "Income" in [this spreadsheet](#)]
11. What is the highest level of education you have completed?
[Below upper secondary, Upper secondary, and Post secondary are coded as the first two, middle three, and last three items, respectively.
US1, US2: Primary school or less; Eighth grade; Some high school; Regular high school diploma/GED or alternative credential; Some college, no degree; 2-year college degree or associates degree (for example: AA, AS); Bachelor's degree (for example: BA, BS); Master's degree or above (MA, MS, MEng, MEd, MSW, MBA, MD, DDS, DVM, LLB, JD, PhD); FR: École primaire / Aucun; Brevet; CAP ou BEP; Baccalauréat professionnel ou technologique; Baccalauréat général; Bac +2 (BTS, DUT, DEUG...); Bac +3 (licence...); Bac +5 ou plus (master, école d'ingénieur ou de commerce, doctorat, médecine, maîtrise, DEA, DESS...)
DE: Keine abgeschlossene Schulbildung / Grundschule; Untere Sekundarstufe (z.B. Haupt- oder Realschulabschluss); Erstausbildung; Beruflicher Abschluss / Ausbildung; Abitur; Zweitausbildung; Bachelor oder Fachhochschulabschluss; Master-Abschluss oder höher

ES: *Educación primaria / No he completado la enseñanza básica; Educación secundaria obligatoria (ESO); Formación profesional básica (FP); Formación profesional de grado medio; Bachillerato; Formación profesional de grado superior; Grado universitario; Máster/doctorado*
UK: *Primary education or less; Some secondary school; GSCE; Vocational Upper secondary (Level 3 award, level 3 certificate, level 3 diploma, advanced apprenticeship, etc.); High school degree (A level); Higher vocational education (Level 4+ award, level 4+ certificate, level 4+ diploma, higher apprenticeship, etc.); Bachelor's Degree (BA, BSc, BEng, etc.); Postgraduate diploma or certificate, Master's Degree (MSc, MA, MBA, etc.) or Ph.D.]*

12. What is your employment status?

Full-time employed; Part-time employed; Self-employed; Student; Retired; Unemployed (searching for a job); Inactive (not searching for a job)

13. Are you a homeowner or a tenant? (Multiple answers are possible)

Tenant; Owner; Landlord renting out property; Hosted free of charge

14. [If lives with partner: What is the estimated value of your household's assets (in U.S. dollars)?

If does not live with partner: What is the estimated value of your assets (in U.S. dollars)?]

Include here all your possessions (home, car, savings, etc.) net of debt. For example, if you own a house worth [\$]300,000 and you have [\$]100,000 left to repay on your mortgage, your assets are [\$]200,000.

I estimate my [If lives with partner: household's] assets net of debt to be:

[Items based on the following individual wealth quintiles, doubled if lives with partner. US1, US2: *Less than \$0 (I have a net debt); Close to \$0; Between \$4,000 and \$60,000; Between \$60,000 and \$190,000; More than \$190,000;* For Eu, the thresholds are: FR: €5/50/150/300k; DE: €0/35/130/280k; ES: €0/50/100/200k; UK: £3/45/115/270k]

15. [US1, US2 (where it is instead asked toward the end, after the vote question)] What do you consider to be your political affiliation, as of today?

Republican; Democrat; Independent; Other; Non-Affiliated

[Eu, US1, US2] Global climate scheme

In the following, we describe two policies, on which we will survey your opinion. To check that you have attentively read the descriptions, **we will ask some understanding questions afterwards: those who get correct answers can win up to \$150.**

Global climate scheme: At the Paris agreement in 2015, all countries have agreed to contain global warming “well below +2 °C”. To limit global warming to this level, **there is a maximum amount of greenhouse gases we can emit globally.**

To meet the climate target, a limited number of permits to emit greenhouse gases can be created globally. Polluting firms would be required to buy permits to cover their emissions. Such a policy would **make fossil fuel companies pay** for their emissions and progressively raise the price of fossil fuels. **Higher prices would encourage people and companies to use less fossil fuels, reducing greenhouse gas emissions.**

In accordance with the principle that each human has an equal right to pollute, the revenues generated by the sale of permits could finance a global basic income. **Each adult in the world would receive [US1, US2: \$30/month; UK: \$30 (that is £25) per month; FR, DE, ES: €30/month]**, thereby lifting out of extreme poverty the 700 million people who earn less than \$2/day.

The typical [American] would lose out financially [US1, US2: \$85, FR: €10, DE: €25, ES: €5, UK: £20] per month (as he or she would face [\$115] per month in price increases, which is higher than the [\$30] they would receive).

The policy could be put in place as soon as countries totaling more than 60% of global emissions agree on it. Countries that would refuse to take part in the policy could face sanctions (like tariffs) from the rest of the World and would be excluded from the basic income.

(Back to Section [2.2.1](#))

16. Who would win or lose financially in the Global climate scheme? [[Figure S12](#)]

Three respondents with the expected answer will get [\$]50 in points.

Typical [Americans] would win and the 700 million poorest humans would win.;

Typical [Americans] would win and the 700 million poorest humans would lose.;

Typical [Americans] would lose and the 700 million poorest humans would win.;

Typical [Americans] would lose and the 700 million poorest humans would lose.

[new page] For your information, the expected answer was *Typical [Americans] would lose and*

the 700 million poorest humans would win from the Global climate scheme. Now, here is the second policy:

National redistribution scheme:

This policy would **increase taxes on the top** [US1, US2: 5%; Eu: 1%] and provide cash transfers to all adults. More precisely, **each [American] adult would receive [\$85] per month** (that is [\$1,000] per year). This would be financed by an increase of the federal income tax on household income in excess of [US1, US2: \$315,000 per year; FR: €15,000 per month; DE: €20,000 per month; ES: €10,000 per month; UK: £15,000 per month], leaving taxes unchanged for income below [\$315,000]. [US1, US2: See more details.] ²⁶

17. Who would win or lose financially in the National redistribution? [Figure S12]

Three respondents with the expected answer will get [\$]50 in points.

Typical [Americans] would win and the richest [Americans] would win.; Typical [Americans] would win and the richest [Americans] would lose.; Typical [Americans] would lose and the richest [Americans] would win.; Typical [Americans] would lose and the richest [Americans] would lose.

[new page] For your information, the expected answer was *Typical [Americans] would win and the richest [Americans] would lose* from the National redistribution scheme.

To help you with the next question, here is a reminder of the policies:

Global Climate scheme:

To limit global warming and reach the international climate objective, the Global climate scheme would **impose a maximum amount of greenhouse gases we can emit globally**.

²⁶8% of U.S. respondents click. They then see the following text, based on taxjusticenow.org by Saez & Zucman (2019): *The marginal income tax rates would evolve as follows:*

Below \$315,000: unchanged

\$315,000 - \$400,000: current rate 32% => new rate 41%

\$400,000 - \$600,000: 35% => 50%

\$600,000 - \$2.5 million: 37% => 60%

\$2.5 - \$5 million: 37% => 65%

Above \$5 million: 37% => 70%

It would **make polluters pay** for their emissions, which in turn would increase fossil fuel prices and discourage polluting activities.

The revenues would finance a **global basic income** of [\$30] per month for all humans, lifting out of extreme poverty the poorest billion people.

Considering the basic income and the fuel price increases, **the typical [American] would lose out financially** [\$85] per month.

National redistribution scheme:

This policy would **increase taxes on the top** [5%] and provide cash transfers to all adults. More precisely, **each [American] would receive** [\$85] per month. This would be financed by an increase of the federal income tax on household income in excess of [\$315,000 per year], leaving taxes unchanged for income below [\$315,000 per year].

18. If both the Global climate scheme and the National redistribution scheme are implemented, how would a typical [American] be financially affected? [Figure S12]

Three respondents with the expected answer will get [\$]50 in points.

A typical [American] would lose out financially.; A typical [American] would neither gain nor lose.; A typical [American] would gain financially.

[new page] For your information, the expected answer was that *A typical [American] would neither gain nor lose* from both schemes combined. [US1, Eu: Now, here are the last two policies:]

[US1: Coal exit:

To reduce CO₂ emissions, this policy would require all U.S. coal power plants to be phased out by 2030. Coal would be replaced by renewable sources like wind and solar panels as well as stronger reliance on gas power plants.

Eu: Thermal insulation plan:

To reduce CO₂ emissions and energy insecurity, this policy would require that all buildings meet energy efficiency targets: at least rating E in 2030 and rating C in 2040. The [UK] government would subsidise half the cost of insulation for all households, and up to 90% for the poorest households. Insulation work would cost [FR, DE: €25; ES: €20; UK: £25] billion a year, but would deliver energy savings greater than this cost.]

[US1: **Marriage only for opposite-sex couples:**

This policy is a proposed amendment to the U.S. Constitution that would legally define marriage as a union of one man and one woman.

*Eu: **Death penalty for major crimes:***

This measure would reintroduce capital punishment for major crimes such as terrorism and mass shootings.]

Now, we will ask your opinion on the [US1, Eu: four] policies.

[Click here for the reminder of the \[US1, Eu: first\] two policies.](#) [Clicking displays the previous summarized descriptions.]

19. [US2] [4 Random branches: control (*nothing*); Question 31 (*field*); Question 32 (*important*); or the following question (*info*).] For information, a recent survey has shown that:

- 64% of Americans support the Global climate scheme.
- 72% of Americans support the National redistribution scheme.

20. Do you support the Global climate scheme? [Figure S1]

Yes; No

21. [Eu, US1] According to you, what percentage of [Americans] answer Yes to the previous question? [Figure S8]

The three people who are closest to the true value get [\$]50 in panel points.

Percentage of [Americans] in favor of Global climate scheme [slider from 0 to 100]

22. Do you support the National redistribution scheme? [Figure S1]

Yes; No

23. [Eu, US1] According to you, what percentage of [Americans] answer Yes to the previous question? [Figure S8]

The three people who are closest to the true value get [\$]50 in panel points.

Percentage of [Americans] in favor of National redistribution [slider from 0 to 100]

24. [Eu, US1] Beware, this question is quite unusual. Among the policies below, **how many** do you support? [Figure S14, Table 1]

[Four random branches. Branch GCS/NR/C/O]

- Global climate scheme
- National redistribution scheme
- [Coal exit]
- [Marriage only for opposite-sex couples]

0; 1; 2; 3; 4

[Branch GCS/C/O]

- Global climate scheme
- [Coal exit]
- [Marriage only for opposite-sex couples]

0; 1; 2; 3

[Branch NR/C/O]

- National redistribution scheme
- [Coal exit]
- [Marriage only for opposite-sex couples]

0; 1; 2; 3

[Branch C/O]

- [Coal exit]
- [Marriage only for opposite-sex couples]

0; 1; 2

[Eu, US1] Conjoint analyses

25. Among the two following bundles of policies, which one would you prefer? [Figure S15]

Note that for each bundle, all policies of the bundle would be implemented at the same time.

Bundle A	Bundle B
[Coal exit]	[Coal exit]
National redistribution scheme	National redistribution scheme
Global climate scheme	

Bundle A; Bundle B

26. Do you support Bundle A (combining [Coal exit], the National redistribution scheme, and the Global climate scheme)?[Figure S1]

Yes; No

27. [new page] Among the two following bundles of policies, which one would you prefer? [Figure S15]

Note that for each bundle, all policies of the bundle would be implemented at the same time.

[Four random branches. Branch C + NR vs. GCS + NR]

Bundle A	Bundle B
[Coal exit]	Global climate scheme
National redistribution scheme	National redistribution scheme

[Branch NR vs. NR + C + GCS]

Bundle A	Bundle B
National redistribution scheme	National redistribution scheme [Coal exit] Global climate scheme

[Branch NR + GCS vs. NR]

Bundle A	Bundle B

Foreign policy	Global climate scheme	-

Platform A; Platform B

[Eu, US2] Perceptions of the GCS

[Eu: two random branches. US2: four random branches and the question is asked (if asked) before Question 20]

31. [Branch: field] When thinking about the Global climate scheme, what comes to your mind?

Please list pros and cons of the Global climate scheme. [Figures S18, S19]
{Open field}

32. [Branch: important] When determining your support or opposition to the Global climate scheme, which points are important to you? [Figure S17]

- It would succeed in limiting climate change.
- It would hurt the [U.S.] economy.
- It would penalize my household.
- It would make people change their lifestyle.
- It would reduce poverty in low-income countries.
- It might be detrimental to some poor countries.
- It could foster global cooperation.
- It could fuel corruption in low-income countries.
- It could be subject to fraud.
- It would be technically difficult to put in place.
- Having enough information on this scheme and its consequences.

Not at all important; Not so important; Quite important; Very important

[Eu, US1] Donation lottery

33. Please select “A little” (this is a test to see if you are paying attention).
Not at all; A little; A lot; A great deal
34. [Two random branches] By taking this survey, you are automatically entered into a lottery to win [\$]100 in panel points. This lottery is unrelated to the previous ones that rewarded answers’ accuracy. In a few days you will know whether you have been selected in the lottery. The payment will be made to you in the same way as your compensation for this survey, so no further action is required on your part.

Should you be selected in the lottery, you can also donate a part of this additional compensation to [[American] / African] people living in poverty through [US1: the charity GiveDirectly. The charity GiveDirectly; Eu: a charity. We would channel this donation to a charity that] provides small amounts of cash to people in need in [[the U.S] / Africa].

In case you are winner of the lottery, what share of the [\$]100 would you donate to [[American] / African] people living in poverty [US1: through GiveDirectly]? [Figure S20, Table S3]

Amount donated to [[American] / African] people in need (in [\$]) [slider from 0 to 100]

[Eu, US2] Wealth tax

[Four random branches: Question 35 then Question 36 (global first); Question 36 then Question 35 (national first); Question 37 (global share); Question 38 (sharing)]

35. Do you support or oppose a tax on millionaires of all countries to finance low-income countries?

Such tax would finance infrastructure and public services such as access to drinking water, healthcare, and education. [Figures S1, S21]

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

36. Do you support or oppose a tax on millionaires in [the U.S.] to finance [US2: affordable housing and universal childcare/pre-K; Eu: finance government hospitals and schools]? [Figures S1, S22]

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

37. Imagine a wealth tax on households with net worth above [\$]5 million, enacted in all countries around the world. In [the U.S.], the tax revenues collected would amount to [US2: \$430; FR: €16; DE: €44; ES: €5; UK: £20] billion per year (that is, [US2: 2%; FR: 0.7%; DE: 1.3%; ES: 0.7%; UK: 0.9%] of [U.S.] GDP), while it would amount to [\$]1 billion in all low-income countries taken together (28 countries, home to 700 million people, most of them in Africa).

Each country would retain part of the revenues it collects, and the remaining part would be pooled at the global level to finance infrastructure and public services in low-income countries.

What percentage should be pooled to finance low-income countries (instead of retained in the country's national budget)? [\[Figure S23\]](#)

Percent of global wealth tax that should go to low-income countries [slider from 0 to 100]

38. Imagine a wealth tax on households with net worth above [\$]5 million, enacted in all countries around the world.

In [the U.S.], the tax revenues collected would amount to [US2: \$430; FR: €16; DE: €44; ES: €5; UK: £20] billion per year (that is, [US2: 2%; FR: 0.7%; DE: 1.3%; ES: 0.7%; UK: 0.9%] of [U.S.] GDP), while it would amount to [\$]1 billion in all low-income countries taken together (28 countries, home to 700 million people, most of them in Africa).

Which of the following options would you prefer? [\[Figure S24\]](#)

- The whole wealth tax financing national budgets in each country. For example, in [US2: the U.S., it could finance affordable housing and universal childcare/pre-K.; Eu-UK: the UK, it could finance the National Health Service and state-funded schools].
- Half of the wealth tax financing national budgets in each country, half of it financing low-income countries. For example, it could finance [US2: universal childcare/pre-K in the U.S.; Eu-UK: state-funded schools in the UK] and access to drinking water, healthcare, and education in Africa.

[Eu, US2] Foreign aid

US2 Please select “A little” (this is a test to see if you are paying attention).

Not at all; A little; A lot; A great deal

39. From your best guess, what percentage of [U.S.] government spending is allocated to foreign aid (that is, to reduce poverty in low-income countries)?

For your information, government spending totals [US2: 38%; FR: 55%; DE: 45%; ES: 42%; UK: 41%] of [U.S.] GDP, it includes [US2: federal, State; Eu: national] and local government spending, and apart from foreign aid, it covers the following items: defense, social security (retirement pensions), health [US2: (including Medicare and Medicaid)], welfare benefits [US2: (including food stamps and EITC)], education, roads, justice, other programs [US2: and federal agencies (including in energy, science...)]. [Figure S27]

Less than 0.1%; 0.1% to 0.2%; 0.3% to 0.5%; 0.6% to 1.0%; 1.1% to 1.7%; 1.8% to 2.6%; 2.7% to 4%; 4.1% to 6%; 6.1% to 9%; 9.1% to 13%; 13.1% to 25%; More than 25%

40. [Two random branches: with or without information on actual amount] [Info: Actually, [US1: 0.4%; FR: 0.8%; DE: 1.3%; ES: 0.5%; UK: 1.7%] of [the U.S.] government spending is allocated to foreign aid.]

If you could choose the government spending, what percentage would you allocate to foreign aid? [Figures S25, S26, S28 and S29]

41. [Asked iff branch: Info and preferred foreign aid is strictly greater than actual foreign aid] Your previous answer shows that you would like to increase [U.S.] foreign aid.

How would you like to finance such increase in foreign aid? (Multiple answers possible) [Figure S30]

Lower spending on defense; Lower spending on retirement pensions; Lower spending on healthcare [US2: (Medicare and Medicaid)]; Lower spending on welfare benefits [US2: (like EITC or food stamps)]; Lower spending on education; Lower spending on other programs [US2: and federal agencies]; Higher taxes on the wealthiest; Higher corporate income tax rate; Higher personal income tax rates; Higher public deficit

42. [Asked iff branch: *Info* and preferred foreign aid is strictly lower than actual foreign aid] Your previous answer shows that you would like to reduce [U.S.] foreign aid.

How would you like to use the freed budget? (Multiple answers possible) [*Figure S31*]

Higher spending on defense; Higher spending on retirement pensions; Higher spending on healthcare [US2: (Medicare and Medicaid)]; Higher spending on welfare benefits [US2: (like EITC or food stamps)]; Higher spending on education; lower spending on other programs [US2: and federal agencies]; Lower taxes on the wealthiest; Lower corporate income tax rate; Lower personal income tax rates; Lower public deficit

[*Eu, US1*] Petition

43. [*Two random branches*] Would you be willing to sign a petition for the [Global climate / National redistribution] scheme? [*Figure S32*]

As soon as the survey is complete, we will send the results to [the U.S. President's office], informing him what share of American people are willing to endorse the [Global climate / National redistribution] scheme. (You will NOT be asked to sign, only your answer here is required and remains anonymous.) Yes; No

[*Eu, US1*] Other policies

44. The following policies are discussed at international negotiations on how to deal with climate change. [*Figures 2 and S33*]

Do you support or oppose the following policies?

- Payments from high-income countries to compensate low-income countries for climate damages
- High-income countries funding renewable energy in low-income countries
- High-income countries contributing \$100 billion per year to help low-income countries adapt to climate change

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

45. Do you support or oppose the following global policies? [Figures 2 and S33]

- Cancellation of low-income countries' public debt
- Democratise international institutions (UN, IMF) by making a country's voting right proportional to its population
- Removing tariffs on imports from low-income countries
- A minimum wage in all countries at 50% of local median wage
- Fight tax evasion by creating a global financial register to record ownership of all assets
- A maximum wealth limit of [US1: \$10 billion; Eu: [€]100 million] for each human

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

46. Currently, [US1: 0.4%; FR: 0.8%; DE: 1.3%; ES: 0.5%; UK: 1.7%] of [U.S.] government spending (that is, [US1: 0.2%; FR: 0.4%; DE: 0.6%; ES: 0.2%; UK: 0.7%] of [U.S.] GDP) is spent on foreign aid to reduce poverty in low-income countries. [Figure S3]

Do you support [the U.S.] transferring more money to low-income countries?

Yes, [U.S.] foreign aid should be increased.; Yes, but only if some conditions are met.; No, [U.S.] foreign aid should remain stable.; No, [U.S.] foreign aid should be reduced.

47. [Asked only if *Yes, but only if some conditions are met.* is chosen] What conditions should be required for [the U.S.] to increase its foreign aid? (Multiple answers possible) [Figures S4, S25]

That recipient countries comply with climate targets and human rights.; That recipient countries cooperate to fight illegal migrations.; That other high-income countries also increase their foreign aid.; That this is financed by increased taxes on millionaires.; That we can be sure the aid reaches people in need and money is not diverted.; Other: [open field]

48. [Asked only if *No, [U.S.] foreign aid should remain stable.* or *No, [U.S.] foreign aid should be reduced.* is chosen] Why do you oppose [the U.S.] increasing its foreign aid? (Multiple answers possible) [Figure S5]

Aid perpetuates poverty as it makes people feel less responsible for themselves.; Aid is not effective as most of it is diverted.; Aid is a pressure tactic for high-income countries that

prevents low-income countries from developing freely.; [The U.S.] is not responsible for what happens in other countries.; Charity begins at home: there is already a lot to do to support the American people in need.; Other: [open field]

[Eu, US1, US2] Values and politics

49. [Eu (where it is instead asked at the beginning of Section “Other Policies”), US1] In international climate negotiations, would you prefer [U.S.] diplomats to defend [U.S.] interests or global justice? [Figure S34]
[U.S.] interests, even if it goes against global justice; [U.S.] interests, to the extent it respects global justice; Indifferent or don't know; Global justice, to the extent it respects [U.S.] interests; Global justice, even if it goes against [U.S.] interests
50. How much did you give to charities in 2022? [Figure S39]
I did not make donations to charities last year.; Less than [\$]100.; Between [\$]101 and [\$]500.; Between [\$]501 and [\$]1,000.; Between [\$]1,001 and [\$]5,000.; More than [\$]5,000.
51. To what extent are you interested in politics? [Figure S40]
Not at all; A little; Moderately; A lot; A great deal
52. Where would you rate yourself on a scale of 1 to 5, where 1 means you think the government should do only those things necessary to provide the most basic government functions, and 5 means you think the government should take active steps in every area it can to try and improve the lives of its citizens? [Figure S41]
Desired involvement of government [slider from 1 to 5]
53. **On economic policy matters**, where do you see yourself on a scale of 1 to 5, where 1 is Left (favoring equality and government interventions) and 5 is Right (favoring free competition and little government intervention)? [Figure S42]
Left (1) to Right (5) on economic issues [slider from 1 to 5]
54. Did you vote in the [2020 U.S. presidential] election? [Figure S43]
Yes; No: I didn't have the right to vote in the U.S.; Prefer not to say
55. [If voted: Which candidate did you vote for in the [2020 U.S. presidential] election? If did not vote: Even if you did not vote in the [2020 U.S. presidential] election, please indicate the candidate that you were most likely to have voted for or who represents your views more closely.] [Figure S44]

[US1, US2: Biden; Trump; Jorgensen; Hawkins; Prefer not to say
FR: candidates at the 2022 presidential election
DE: parties with more than 1% of votes at the 2021 federal election and *Other*
ES: lists with more than 0.9% at the November 2019 general election and *Other*
UK: parties with more than 0.5% of votes at the 2019 general election and *Other*]

56. To what extent do you think the following issues are a problem? [Figure S35]

- Income inequality in [the U.S.]
- Climate change
- Global poverty

Not an important issue for me; An issue but there are other priorities; An issue but we already do what we can; An important issue, we should do more; One of the most pressing issue of our time

57. What group do you defend when you vote? [Figure S36]

Sentient beings (humans and animals); Humans; [Eu: Europeans]; [Americans]; People sharing my culture or religion; [US1, US2: My State]; [US1, US2: My town; Eu: My country, region or town]; My relatives and/or colleagues; My family and myself

[Eu, US1] Prioritization

58. In this question, you have 100 points that you can allocate to different policies. The more you give points to a policy, the more you support it.

How do you allocate the points among the following policies? [Figures S37 and S38]

You can adjust the number of points either using the slider or entering the number of your choice on the right-hand-side. **The sum of points must equal exactly 100.** By pushing the last slider to the right, the total will automatically adjust to 100. Please read the 6 options before making your choice.

See the sheet “Policies” in [this spreadsheet](#) for the pool of policies in each country.

[sliders from 0 to 100]

[FR, DE, ES] ETS2

59. Similar to the Global Climate Scheme, the European Climate Scheme would impose a maximum amount of greenhouse gases we can emit across the EU in the buildings and transport sectors. It would make polluters pay for their emissions, which in turn would increase fossil fuel prices and discourage polluting activities. Several options are possible regarding the use of the scheme's revenues:

- Provide an equal cash transfer of €105 per year to each European.
- Provide a country-specific cash transfer to each European, proportional to their country's emissions: people in countries with higher emissions per person (like Germany) would receive more than people in countries with lower emissions (like Romania). For information, people in [Germany] would receive €[FR: 110; DE: 130; ES: 90]/year.
- Finance low-carbon investments: thermal insulation of buildings, switch to clean sources of heating, public transportation, and charging stations for electric vehicles.
- Provide cash transfers to the most vulnerable half of Europeans and finance low-carbon investments.

Do you support or oppose the European Climate Scheme in case the revenue is used to... ?

- Provide an equal cash transfer to each European
- Provide a country-specific cash transfer to each European
- Finance low-carbon investments
- Provide cash transfers for the most vulnerable Europeans and low-carbon investments

Strongly oppose; Somewhat oppose; Neither support nor oppose; Somewhat support; Strongly support

60. [Asked iff none of the four variants of the European Climate Scheme is (somewhat or strongly) supported] Why do you not support a European Climate Scheme? (Multiple answers possible)

I am opposed to climate policy being decided at the EU level, it should be decided at the national level;

I would prefer if the revenues were used in a different way (beyond the four suggestions above) than previously suggested;

I would prefer if decreasing carbon emissions were regulated by other climate policies;

I am generally opposed to additional, or more ambitious, climate policies;

I do not fully understand how the European Climate Scheme is supposed to work;

I don't know

[Eu, US1, US2] Feedback

61. Do you feel that this survey was politically biased? [Figure S45]

Yes, left-wing biased; Yes, right-wing biased; No, I do not feel it was biased

62. [US2 Asked only to one random third of the respondents, instead of the feedback Question 63] According to you, what should high-income countries do to fight extreme poverty in low-income countries? [Figure S46]

{Open field}

63. The survey is nearing completion. You can now enter any comments, thoughts or suggestions in the field below.

{Open field}

64. Lastly, are you interested to be interviewed by a researcher (through videoconferencing) for 30 min?

This is totally optional and will not be rewarded.

Yes; No

E Net gains from the Global Climate Scheme

To specify the GCS, we use the IEA's 2DS scenario (IEA 2017), which is consistent with limiting the global average temperature increase to 2°C with a probability of at least 50%. The paper by Hood (2017) contributing to the Report of the High-Level Commission on Carbon Prices (Stern & Stiglitz 2017) presents a price corridor compatible with this emissions scenario, from which we take the midpoint. The product of these two series provides an estimate of the revenues expected from a global carbon price. We then use the UN median scenario of future population aged over 15 years (*adults*, for short). We derive the basic income that could be paid to all adults by recycling the revenues from the global carbon price: evolving between \$20 and \$30 per month, with a peak in 2030. Accounting for the lower price levels in low-income countries, an additional income of \$30 per month would allow **670 million people** to escape extreme poverty, defined with the threshold of \$2.15 per day in purchasing power parity.²⁷

To estimate the increase in fossil fuel expenditures (or “cost”) in each country by 2030, we make a key assumption concerning the evolution of the carbon footprints per adult: that they will decrease by the same proportion in each country. We use data from the Global Carbon Project (Peters et al. 2012). In 2030, the average carbon footprint of a country c , e_c , evolves from baseline year b proportionally to the evolution of its adult population $\Delta p_c = p_c^{2030} / p_c^b$. Thus, the global share of country c 's carbon footprint, s_c , is proportional to $\sigma_c = e_c \Delta p_c$, and as countries' shares sum to 1, $s_c = \frac{\sigma_c}{\sum_k \sigma_k}$. Multiplying country c 's emission share with global revenues in 2030, R , and dividing by c 's adult population in year y , yields its average cost per adult: $R \cdot s_c / p_c^y$. Using findings from Ivanova & Wood (2020) for Europe and Fremstad & Paul (2019) for the U.S., we approximate the median cost as 90% of the average cost. Finally, the net gain is given by the basic income (\$30 per month) minus the cost. We provided consistent estimates of net gains in all surveys (using $y = b = 2015$), though in the global survey we gave the average net gains vs. the median ones in the complementary surveys. The latter are shown in Figure S51. For the record, Table S4 also provides an estimate of *average* net gains (computed with

²⁷The average carbon footprint of Sub-Saharan Africa is 0.75tCO₂ per capita (World Bank), and it is even lower for people living in extreme poverty, under one tenth of the world average of about 5tCO₂ per capita (Chancel & Piketty 2015). Under a GCS with a cash transfer of \$30 per person, if one's emission is one tenth of the world average, their net gain would be \$27 per month in nominal terms. In regions with extreme poverty like Sub-Saharan Africa (excluding high-income countries), the conversion factor from Market Exchange Rate to Purchasing Power Parity (PPP) is 2.4 (computed as the ratio of the World Bank series relating the GDP per capita of Sub-Saharan Africa in PPP and nominal). Therefore, the net gain for the extreme poor is \$65 per month (or \$2.13 a day) in PPP, enough to lift them out of extreme poverty.

$b = 2019$ and $y = 2030$).²⁸

Estimates of the net gains from the Global Climate Scheme are necessarily imprecise, given the uncertainties surrounding the carbon price required to achieve emissions reductions as well as each country's trajectory in terms of emissions and population. These values are highly dependent on future (non-price) climate policies, technical progress, and economic growth of each country, which are only partially known. Integrated Assessment Models have been used to derive a Global Energy Assessment (Johansson et al. 2012), a 100% renewable scenario (Greenpeace 2015) as well as Shared Socioeconomic Pathways (SSPs), which include consistent trajectories of population, emissions, and carbon price (Bauer et al. 2017; Fricko et al. 2017; Riahi et al. 2017; van Vuuren et al. 2017). Instead of using some of these modelling trajectories, we relied on a simple and transparent formula, for a number of reasons. First and foremost, those trajectories describe territorial emissions while we need consumption-based emissions to compute the incidence of the GCS. Second, the carbon price is relatively low in trajectories of SSPs that contain global warming below 2°C (less than \$35/tCO₂ in 2030), so we conservatively chose a method yielding a higher carbon price (\$90 in 2030). Third, modelling results are available only for a few macro regions, while we wanted country by country estimates. Finally, we have checked that the emissions per capita given by our method are broadly in line with alternative methods, even if it tends to overestimate net gains in countries which will decarbonize less rapidly than average.²⁹ For example, although countries' decarbonization plans should realign with the GCS in place, India might still decarbonize less quickly than the European Union, so India's gain and the EU's loss might be overestimated in our computations. For a more sophisticated version of the Global Climate Scheme which includes participation mechanisms preventing middle-income countries (like China) to lose from it and estimations of the Net Present Value by country, see Fabre (2023).

(Back to Section 2.2.2)

²⁸2015 was the last year of data available when the global questionnaire was conceived (OECD data was then used – it does not cover all countries but give identical rounded estimates than those recomputed from the Global Carbon Project data for our complementary surveys). 2030 was chosen as the reference year as it is the date at which global carbon price revenues are expected to peak (and the GCS redistributive effects would be largest), and the GCS could not realistically enter into force before that date. In the surveys, we chose $y = b = 2015$ rather than $b = 2019$ and $y = 2030$ to get more conservative estimates of the monthly cost in the U.S. (\$20 higher than the other option) and in Europe (€5 or £10 higher).

²⁹Computations with alternative methods can be found on [our public repository](#).

Figure S51: Net gains from the Global Climate Scheme.

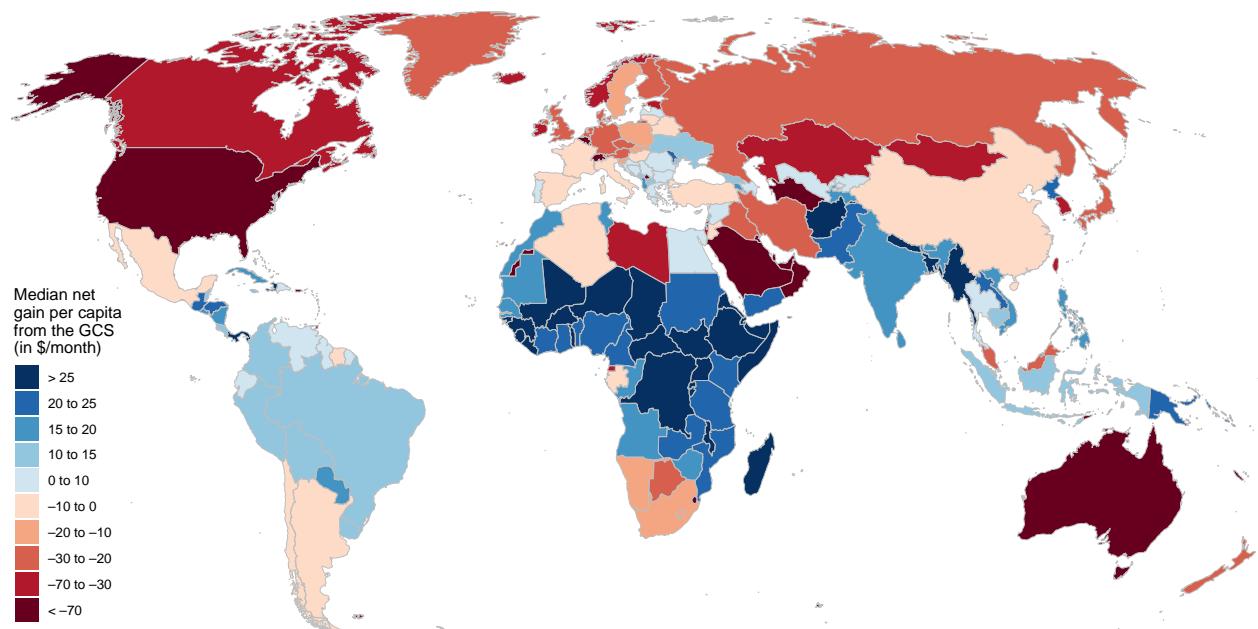

Table S4: Estimated net gain from the GCS in 2030 and carbon footprint by country.

	Mean net gain from the GCS (\$/month)	CO ₂ footprint per adult in 2019 (tCO ₂ /y)			
			Mexico	2	5.6
			Ukraine	2	5.6
			Uzbekistan*	4	5.1
			Argentina	5	4.9
			Thailand	6	4.6
			Egypt	12	3.6
			Indonesia	13	3.3
			Colombia	15	3.0
Saudi Arabia	-93	24.0	Brazil	15	2.9
